

Crypto Project Research Report

Deep-Dive Analysis | June 2026 | NBZ / NASIR

A comprehensive, independently researched analysis of Humanity Protocol covering Team, Technology, Tokenomics, Market Overview, Use Cases, Competitors, Recent News & Investment Risk Assessment — sourced from verified and up-to-date public data.

Research by NBZ / NASIR

01 ·

FIELD	DETAIL
Project Name	Humanity Protocol
Token Ticker	H
Blockchain Type	Layer-2 zkEVM (Ethereum L2, built on Polygon CDK)
Founded	2023
TGE (Token Launch)	June 25, 2025
Consensus	Proof of Humanity (PoH) → Proof of Trust (PoT)
Smart Contracts	EVM-compatible (Solidity / Hardhat)
Headquarters	Global (Foundation-based, founder from Hong Kong)
Current Focus	Decentralized Identity, Sybil Resistance, AI-era Human Verification

The problem Humanity Protocol solves is both urgent and expanding: as AI-generated bots, deepfakes, and Sybil attacks flood Web2 and Web3 platforms, distinguishing real humans from automated agents becomes critical infrastructure. Traditional identity models — whether centralised (each app stores its own user database) or federated (login via Google or Apple) — still rely on monopolised, centralised data custodians that represent both a privacy risk and a single point of failure. Humanity Protocol replaces this entirely with a Self-Sovereign Identity (SSI) framework, where users control their own verifiable credentials, stored on-chain and portable across all applications and blockchains without any middleman.

The protocol's verification method — palm scanning — is non-invasive, smartphone-compatible, and free from the racial bias problems associated with facial recognition. Biometric data is immediately converted into cryptographic hashes via zero-knowledge proofs, meaning no raw personal information ever touches a server or the blockchain. This positions Humanity as the open identity layer for Web3, and increasingly, for real-world enterprise and regulatory use cases.

02 ·

NAME	ROLE	KEY BACKGROUND
Terence Kwok	CEO & Founder	Serial entrepreneur from Hong Kong; founder of Tink Labs (Asia's first unicorn). Deep expertise in blockchain, Web3, and technology integration.
Yeewai Chong	Interim Foundation CEO	Former executive at Morgan Stanley and Capital. Brings institutional finance and organisational leadership to the Foundation.
Mario Nawfal	Foundation Director	Prolific Web3 media figure and entrepreneur. Host of major crypto Twitter Spaces; early Humanity investor and ecosystem advocate.

NAME	ROLE	KEY BACKGROUND
Yat Siu	Foundation Director	Co-founder and Executive Chairman of Animoca Brands — one of the largest Web3 investment firms globally. Key strategic and ecosystem connector.

Yeewai Chong's Morgan Stanley background gives the Foundation credibility in institutional settings — critical as Humanity targets enterprise KYC partnerships and financial credential screening. Mario Nawfal's presence as a Foundation Director is unusual in crypto: rather than a purely technical or venture-capital appointment, Nawfal represents the media and community distribution layer, having hosted Twitter Spaces that regularly reach hundreds of thousands of listeners. Yat Siu of Animoca Brands rounds out the leadership with Web3 investment reach across gaming, NFTs, and decentralised infrastructure — aligning Humanity's identity layer with the broader open metaverse ecosystem that Animoca champions.

The team's composition — a unicorn-founder CEO, a Wall Street-trained Foundation operator, a media-native director, and one of Web3's most recognised venture figures — reflects a deliberate strategy to cover the four critical axes of a protocol launch: technology, finance, distribution, and ecosystem.

03 •

COMPONENT	DESCRIPTION
Blockchain Layer	Ethereum L2 zkEVM built on Polygon CDK — EVM-compatible, ZK-secured
Core Mechanism	Proof of Humanity (PoH) → evolving to Proof of Trust (PoT)
Biometric Method	Palm scanning (smartphone-compatible, non-invasive, AI-model powered)
Privacy Tech	Zero-Knowledge Proofs (ZK proofs) — no raw biometric data stored on-chain
Identity Framework	Self-Sovereign Identity (SSI) — users own and control all their credentials
Credentials	Decentralised Identifiers (DIDs) + Verifiable Credentials (VCs)
Storage Layer	Walrus Protocol (DePIN-based decentralised storage, migrated Dec 2025)
Developer Integration	React SDK, Connect SDK, REST API, Verification Oracle (smart contract)
Node Validators	zkProoferers — verify human identities using ZK proof model, earn \$H rewards
Open Source	Yes — github.com/humanity-org

Phase 2 elevates this into a full identity layer: Proof of Trust (PoT). Rather than just confirming uniqueness, PoT enables verifiable claims about a user's specific attributes — age, residency, employment, education, compliance status — all provable without disclosing the underlying data. This is made possible by combining Decentralised Identifiers (DIDs), Verifiable Credentials (VCs), and ZK proofs into a trustless verification stack. A user can prove they are over 18 to an age-gated application without sharing their date of birth. They can prove they are a US resident for compliance purposes without uploading a passport. Third-party 'Verifier' apps can confirm credential authenticity on-chain independently, with no central authority involved at any point in the process.

In December 2025, Humanity migrated its data storage from traditional cloud infrastructure to the Walrus Protocol — a Decentralised Physical Infrastructure Network (DePIN) — addressing critical scalability and persistence requirements for Phase 3 palm vein verification, which uses specialised hardware scanners for the highest-assurance verification tier. The developer experience has been a strategic priority: Humanity offers an SDK that functions like 'Sign in with Humanity' — the same OAuth pattern as Google or GitHub login, with a working integration achievable in approximately ten minutes. This drastically lowers the barrier for non-blockchain developers to integrate Sybil resistance into any application.

04 ·

USE CASE	DESCRIPTION	EXAMPLE / SCALE
Sybil Resistance (Web3)	Ensure each wallet = one real human; eliminate airdrop farming bots	Live across multiple DeFi and NFT protocols
KYC / Compliance	Privacy-preserving Know Your Customer — prove identity without data handover	Targeting Korean financial institutions (2026)
Age Verification	Prove age without revealing date of birth via ZK proof	Enterprise SDK integrations
Bot & Deepfake Prevention	Platforms verify real human engagement; eliminates AI-generated bot traffic	Web2 brands and advertisers
Decentralised Voting	On-chain governance where each vote = verified unique human	DAO governance systems
Loyalty & Rewards	Verified human-only loyalty programs preventing manipulation	Retail and brand partnerships
Cross-chain Identity	Single Human ID portable across all blockchains and Web2/Web3 apps	Multi-chain DeFi, gaming, social
Genomics Integration	Future: linking verified identity to genomic/health credentials	Prenetics partnership (announced 2025)
Ticketing & Access	Controlled-access events where only verified humans can purchase	Event and venue platforms
Financial Credentials	Prove income, employment or residency for DeFi lending and credit	Under development — Phase 2 roadmap

The most immediate and proven use case is Sybil resistance in Web3. A single motivated actor can currently operate tens of thousands of wallets to farm airdrops — draining token distributions intended for genuine community members. Humanity's Proof of Humanity makes this economically and practically impossible by binding each wallet to a unique, biometrically-verified human. The protocol's founder, Terence Kwok, has cited this as the primary driver of early adoption, noting that projects lose enormous value to airdrop farming when community tokens are captured by automated wallet farms rather than real users.

Beyond crypto, the advertising and media industry represents a massive addressable market. Today's internet is saturated with AI-generated content consumed by bot accounts, producing inflated engagement metrics that advertisers pay billions for without reaching real humans. Humanity's SDK enables platforms to verify that their user base consists of real people — creating a new category of 'verified human engagement' that commands premium pricing. Looking further ahead, the genomics integration with Prenetics signals ambitions to become the identity layer for health data — where privacy-preserving credential proofs could unlock entirely new models for medical research, insurance, and personalised healthcare.

05 ·

METRIC	DATA
Human IDs Created	1M+ on testnet (reached pre-TGE); growing post-mainnet
TGE Date	June 25, 2025
Governance Model	On-chain community governance (decentralising from Foundation)
Korea Market	Largest and most active regional market as of 2026
Developer Ecosystem	SDK, API, Verification Oracle — React, Connect, REST integrations
Social Presence	Active Twitter/X, Telegram, Discord community
Partnerships Engaging Community	Prenetics, A Chain, Terminal 3, Animoca Brands ecosystem
Validator Nodes	zkProofer network — permissionless node operators earning \$H rewards

Humanity Protocol built significant community momentum before its Token Generation Event through a testnet phase that accumulated over one million Human IDs — a meaningful figure because each ID represents a real person who completed biometric verification, not a throwaway wallet creation. This pre-TGE user base provided the protocol with both a proof-of-concept for its verification technology and a ready community of verified users at launch. The Korean market has emerged as the protocol's largest and most active region, driven by strong local interest in digital identity infrastructure and crypto adoption. Humanity has actively pursued Korean institutional partnerships around KYC, compliance, and financial credential screening — areas where its privacy-preserving approach offers a regulatory-friendly alternative to traditional identity verification vendors.

Funding Rounds

ROUND	DATE	AMOUNT	VALUATION	LEAD INVESTORS
Strategic	Feb 2024	Undisclosed	–	Various strategic partners
Seed	May 2024	\$30M	\$1.0B FDV	Pantera Capital, Jump Crypto
Series A	Jan 2025	\$20M	\$1.1B FDV	Pantera Capital, Jump Crypto
Latest	Jan 2026	Undisclosed	\$1.1B FDV	Institutional follow-ons

Investor Roster

TIER	INVESTOR	TYPE
Lead	Pantera Capital	Venture — Tier 1 crypto-native fund
Lead	Jump Crypto	Venture — Tier 1 trading & crypto fund
Angel	Sandeep Nailwal	Co-founder of Polygon — strategic Web3 signal
Angel	Paul Taylor	Angel investor
Tier 2	Hashed	Venture — leading Korean crypto fund
Tier 2	Mechanism Capital	Venture
Tier 2	MH Ventures	Venture
Tier 3	Animoca Brands	Venture — major Web3 / gaming ecosystem player
Tier 3	Foresight Ventures	Venture
Tier 3	LongHash Ventures	Venture — Asia-focused Web3
Tier 3	Cypher Capital	Venture
Tier 3	IBC Ventures	Venture
Tier 4	CMCC Global	Venture
Tier 4	AZA Ventures	Venture
Tier 4	Wise3 Ventures	Venture
Tier 4	Hex Trust	Venture / Custodian — acquired \$42M in H tokens (June 2026)

Sandeep Nailwal's angel investment carries strategic weight beyond its financial size. As the co-founder of Polygon — the infrastructure that underpins Humanity's own L2 deployment via Polygon CDK — his personal backing creates a

credibility bridge between the two ecosystems. Animoca Brands' participation as both an investor and through Yat Siu's Foundation Director role creates a dual relationship: financial alignment and active ecosystem stewardship. Hex Trust, a licensed digital asset custodian, made a notable market-side move in June 2026 by acquiring \$42 million worth of H tokens — a signal that institutional custodians are taking long-term positions in the asset, potentially reducing future sell pressure from early investors.

PARAMETER	DETAIL
Token Symbol	H
Token Standard	ERC-20 (Ethereum-compatible)
Total / Max Supply	10,000,000,000 H (10 Billion — fixed, no inflation)
Circulating Supply	~1.825 Billion H (~18.25% of total as of June 2026)
Next Unlock	June 25, 2026 — Early Contributors allocation
Full Unlock Schedule	Extends through 2029 (multi-year vesting)
Token Utility	Validator rewards, staking (on-chain staking live June 2026), governance
Primary Exchange	Listed on major CEXs post-TGE (June 25, 2025)
Deflationary Design	Fixed supply with no minting mechanism — inherent scarcity

Token Allocation Breakdown

ALLOCATION	TOTAL %	UNLOCKED	STILL LOCKED	NOTES
Ecosystem Fund	24%	5.5%	18.5%	Largest allocation — developer grants & ecosystem growth
Early Contributors	19%	0%	19%	1.90B H — fully locked; next release June 25, 2026
Identity Verification Rewards	18%	2.57%	15.4%	Rewards for palm scan participants and zkProofer nodes
Foundation Operations	12%	7.38%	4.63%	Foundation treasury for operations and development
Community Incentives	12%	12%	0%	Fully unlocked — distributed to community participants
Investors	10%	0%	10%	Fully locked — investor vesting ongoing
Strategic Reserve	5%	0.25%	4.75%	Human Institute strategic reserve

However, the tokenomics also contain meaningful demand-side mechanisms. The Identity Verification Rewards allocation (18% of total supply) is distributed to real users who complete palm scanning and to zkProofer nodes that validate ZK proofs — creating a circular economy where network growth directly drives token distribution to active participants rather than passive holders. The launch of on-chain H staking in June 2026 introduces a lock-up mechanism

that can absorb circulating supply and reduce liquid float. The Community Incentives allocation being fully unlocked (12%) reflects an active distribution strategy during the early growth phase, prioritising ecosystem activation over price suppression caution.

The most important near-term event in the token schedule is the June 25, 2026 Early Contributors unlock. As the largest single locked tranche at 1.90 billion H, this event will materially increase circulating supply and represents the primary short-term volatility risk for holders. Longer term, the fixed supply cap combined with growing network utility — each new integration, enterprise partnership, and verified user increases organic demand for H as the protocol's fee and reward token — creates the foundation for a supply-constrained appreciation thesis as adoption compounds.

08 ·

METRIC	DATA
Token Symbol	H
Current Price	~\$0.098 (June 9, 2026 — post sharp correction)
CMC Rank	#105 (fluctuating; peaked at #105 pre-correction)
All-Time High	~\$0.8358 (June 1, 2026)
All-Time Low	~\$0.024 (post-TGE initial period)
Market Cap (approx.)	~\$179M at current price (~\$0.098 × 1.825B circulating)
FDV at ATH	~\$8.36B at \$0.8358 peak
Current FDV	~\$980M at current price
24h Change	▼ 86.39% (June 8–9, 2026 cliff event)
30-Day Change	▼ 51.24%
YTD Change	▼ 43.61%
Total Funding Raised	\$50M+ across seed, Series A and strategic rounds
Last Valuation	\$1.1 Billion FDV (January 2026 round)

The sharp reversal on June 8–9, 2026 — an 86% single-day decline — represents one of the most severe corrections in recent crypto history for a top-200 asset. The scale of the drop suggests a combination of factors: profit-taking after a near-parabolic move from lows, potential liquidation cascades in leveraged positions, and possibly early anticipation of the June 25 Early Contributors unlock. The current price of approximately \$0.098 places the token 88% below its all-time high reached just eight days prior — creating a price context that is simultaneously a risk signal and a potential mean-reversion opportunity depending on whether the underlying adoption thesis holds.

From a fundamental valuation perspective, the current market cap of approximately \$179M against a \$1.1 billion FDV (set by institutional investors in January 2026) implies the market is currently pricing H at a significant discount to its last private round valuation. The Hex Trust acquisition of \$42 million in H tokens as recently as June 5 — just days before the crash — is a notable data point: a licensed institutional custodian made a large directional bet on the asset at prices significantly above current levels.

09 ·

PROJECT	TYPE	METHOD	PRIVACY	STRENGTH vs HUMANITY
Worldcoin (WLD)	Proof of Personhood	Iris scan (Orb hardware)	ZK proofs	Larger scale but Orb hardware is invasive & expensive
Civic (CVC)	KYC / Identity	Document verification	Moderate	Web2-style KYC; not privacy-preserving or ZK-native
Proof of Humanity	DAO-based PoP	Video + vouching	Low	Decentralised but slow, gameable, not scalable
BrightID	Social graph identity	Social connections	Moderate	No biometrics; relies on trust networks, not proofs
Idena	AI test-based PoP	Synchronous flip tests	Moderate	Novel but requires scheduled global participation
Humanity Protocol	zkEVM L2 + PoH/PoT	Palm scan + ZK proofs	High	Smartphone-native, non-invasive, enterprise SDK

Humanity's competitive moat deepens as it transitions from Phase 1 (Proof of Humanity) to Phase 2 (Proof of Trust). While competitors like Worldcoin remain focused on the single-use case of confirming human uniqueness, Humanity's PoT framework expands the addressable market to every credential that currently requires a centralised trusted issuer — age, residency, employment, education, compliance status, and more. This is not a feature addition; it is a category expansion from identity confirmation to identity infrastructure, making Humanity a platform rather than a point solution.

The developer experience advantage is also underappreciated. While most identity protocols require deep Web3 expertise to integrate, Humanity's SDK functions identically to standard OAuth flows — meaning any developer who has implemented Google login can integrate Humanity's human verification in minutes. This dramatically expands the potential integration surface to the entire Web2 developer ecosystem, not just blockchain-native teams.

10 ·

DATE	EVENT
Jun 2026	H drops 86% in 24 hours (June 8–9) after reaching ATH of \$0.8358 on June 1 — sharp correction following parabolic rally.
Jun 2026	Hex Trust acquires \$42M in H tokens (June 5) — institutional custodian takes large directional position ahead of ATH.
Jun 2026	H tops weekly crypto gainers (June 7) with 55% surge, supported by new on-chain H staking going live.
Jun 2026	H surges as part of broader AI token rally driven by SpaceX IPO interest and xAI / AI narrative momentum.
Jan 2026	\$20M funding round announced, co-led by Pantera Capital and Jump Crypto at \$1.1B FDV valuation.
Jan 2026	Fireblocks partnership announced — institutional custody and settlement infrastructure integration.
Dec 2025	Migration to Walrus Protocol (DePIN decentralised storage) completed — critical for Phase 3 scaling.
Dec 2025	\$H token reaches new ATH of approximately \$0.24 coinciding with Walrus migration and Sui ecosystem deepening.
Oct 2025	Partnerships announced with Prenetics (genomics integration) and A Chain; genomics credential use case flagged.
Jun 2025	Token Generation Event (TGE) completed on June 25, 2025 — H token launches publicly.
Jan 2025	1 million Human IDs reached on testnet — major adoption milestone before mainnet launch.
May 2024	\$30M seed round closed at \$1.0B FDV — unicorn status achieved pre-TGE.

The June 2026 events represent the most defining period in Humanity Protocol's public market history. The combination of a 55% weekly gain, a new all-time high, institutional acquisition, and then an 86% single-day reversal compressed an enormous amount of price action and market sentiment into a single week. The Hex Trust \$42M purchase on June 5, followed by the crash on June 8, will be studied as a case study in the disconnect that can develop between institutional conviction and retail-driven price discovery in illiquid altcoin markets. The January 2026 funding round at \$1.1B FDV — co-led by two of the most respected names in crypto — represents the clearest fundamental anchor: institutional allocators with deep due diligence processes valued the protocol at over a billion dollars just months before the current price implies a \$980M FDV.

11 ·

BULLISH CASE ▲

- + Fixed 10B supply with only 18.25% circulating — structural scarcity as adoption grows
- + Pantera Capital + Jump Crypto co-led at \$1.1B FDV — elite institutional conviction
- + On-chain H staking now live — new demand-side absorption mechanism for circulating supply
- + Worldcoin regulatory headwinds (iris ban in EU/India) create direct market share opportunity
- + Phase 2 Proof of Trust expands from identity confirmation to full credential infrastructure
- + Developer-friendly SDK (OAuth-style) opens entire Web2 developer market to integration
- + Korea's largest crypto market is Humanity's most active region — strong regional tailwind
- + Current price ~88% below ATH with institutional valuation anchored at \$1.1B FDV
- + Hex Trust's \$42M token acquisition signals custodian-level institutional positioning
- + AI era fundamentally increases demand for real-human verification infrastructure

BEARISH RISKS ▼

- June 25, 2026 Early Contributors unlock (1.90B H = 19% of supply) — major sell pressure event
- Investors' 10% allocation fully locked but vesting — multi-year overhang on price
- 86% single-day crash demonstrates extreme illiquidity and volatility in thin market conditions
- Worldcoin has significantly larger deployment scale and brand recognition globally
- Limited public GitHub activity reported as of mid-2025 — execution transparency concerns
- AI narrative dependency — if AI x crypto thesis fades, core valuation driver weakens
- No hard cap enforcement mechanism visible if governance votes to change parameters
- Phase 3 hardware scanners (palm vein) require physical distribution — slow and capital-intensive
- Macro altcoin risk — BTC dominance spikes suppress all altcoin performance

RISK FACTOR	DETAIL
Supply Unlock Risk	The June 25, 2026 Early Contributors unlock releases 1.90B H into a market where only ~1.825B currently circulates — effectively doubling the float. This is the single largest near-term risk.
Execution Risk	Phase 2 (Proof of Trust) and Phase 3 (palm vein hardware) require significant technical and logistical execution. Limited public codebase updates in 2025 raised questions about development pace.
Competition Risk	Worldcoin, despite regulatory friction, has far greater distribution and name recognition. If regulatory pressure on iris scanning eases, Worldcoin's scale advantage becomes decisive.
AI Narrative Risk	Much of Humanity's 2026 rally was driven by AI token sentiment rather than protocol adoption metrics. Narrative-driven rallies reverse as fast as they form.
Liquidity Risk	An 86% single-day move in a top-200 asset reveals dangerously thin order books. Large sellers can move the price dramatically with relatively modest volume.
Regulatory Risk	Biometric data processing, even via ZK proofs, may face novel regulatory frameworks in key markets. GDPR-equivalent challenges in Europe remain an open question.

NBZ RESEARCH VERDICT

Humanity Protocol occupies a genuinely important niche: decentralised human identity verification is foundational infrastructure for the AI era, and the protocol's privacy-preserving, smartphone-native approach gives it a defensible competitive position against hardware-dependent alternatives like Worldcoin. The team carries real credibility — a unicorn-founding CEO, Wall Street operator, and two of Web3's most prominent figures — backed by elite allocators who have maintained conviction across multiple funding rounds. However, the token's 86% single-day collapse and the imminent Early Contributors unlock represent acute near-term risks that override the long-term thesis for most risk profiles. At current prices (~\$0.098), the asset trades at roughly a 91% discount to its last private round FDV, which is either a deep value entry or a reflection of broken market structure — likely both simultaneously. This is a high-conviction, high-volatility, high-patience position. Not financial advice.
