BUBBLEMAPS

\$BMT · Institutional Research Report

A visual on-chain analytics platform that exposes hidden wallet clusters, insider concentration, and token-distribution fraud — evaluated across technology, tokenomics, funding, market performance, ecosystem traction, and forward-looking risk.

TICKER	SECTOR	CHAIN	REPORT DATE
BMT	On-Chain Analytics / Investigations	BNB Chain + Solana (LayerZero)	August 2026

SECTION 01

Project Overview

Bubblemaps (BMT) is a blockchain analytics platform that transforms complex on-chain data into interactive "bubble maps," where each wallet is represented as a bubble sized by holdings, and lines between bubbles reveal historical token transfers. The platform's purpose is to make wallet clustering, insider concentration, and coordinated manipulation visible to ordinary users without requiring advanced blockchain expertise — turning dense, text-based explorer data into an intuitive visual investigation tool.

Founded in 2022 by Nicolas Vaiman, Arnaud Droz, and Léo Pons, Bubblemaps built its reputation pre-token through high-profile public investigations, including uncovering a hidden whale cluster controlling over 10% of Shiba Inu's supply and exposing wash trading in the Squiggles NFT collection. The BMT token launched on March 11, 2025 via a Binance-hosted IDO, with supply split evenly across BNB Chain and Solana and connected through LayerZero for cross-chain interoperability.

\$0.0242 PRICE (SNAPSHOT)	\$17.54M MARKET CAP	\$24.11M FULLY DILUTED VALUATION	#700 MARKET RANK	+49.4% 24H MOVE (BINANCE)
---	---	--	--	---

Snapshot

Metric	Value
Token Ticker	BMT
Category	On-Chain Analytics / Wallet Clustering / Investigations
Circulating Supply	727.68M BMT
Total Supply / Max Supply	1.00B BMT
24h Trading Volume	\$187.34M
All-Time High	\$0.3212
All-Time Low	\$0.01088
Token Generation Event (TGE)	March 11, 2025
Website	bubblemaps.io
Whitepaper / Docs	wiki.bubblemaps.io

BMT is trading roughly 92% below its all-time high but has posted a dramatic, uniform single-day rally (+47–50% across nearly every major exchange) in this report's snapshot — a scale of move consistent with a specific news catalyst rather than routine volatility, discussed further in Section 7.

SECTION 02

Problem & Solution

The Problem

Blockchain's public ledgers are, in principle, fully transparent — but in practice, raw transaction data on tools like Etherscan or Solscan is dense, text-heavy, and nearly impossible for ordinary traders to parse. This opacity-through-complexity lets bad actors hide insider concentration, wash trading, and coordinated wallet clusters in plain sight, since detecting these patterns manually requires significant blockchain forensics expertise most retail participants don't have.

The Solution

- **Bubble Map visualization** — each wallet appears as a bubble sized by token holdings, with connecting lines showing historical transfers, making concentration and relationships immediately visible rather than buried in transaction lists.
- **Magic Nodes** — a behavioral clustering feature that identifies indirect wallet relationships even when wallets have never directly transacted with each other, surfacing coordinated groups that traditional explorers cannot detect.
- **Time Travel** — lets users step through historical distribution snapshots to see how token ownership and concentration evolved, useful for identifying when and how insider positions were built.
- **Intel Desk** — a community-powered investigations feature where BMT holders propose, vote on, and fund crowdsourced investigations into suspicious projects, aligning token incentives with the platform's core transparency mission.
- **Premium analytics via BMT** — holding BMT unlocks AI-based cluster interpretation, profit-and-loss computation for specific wallets, cross-chain analysis, and access to maps of the top 1,000 holders for any given token.

SECTION 03

Technology & Architecture

Bubblemaps' core technology ingests on-chain transaction data across multiple blockchains — including Ethereum, Solana, Polygon, Avalanche, BNB Chain, and Base — and applies clustering algorithms to group wallets that show behavioral or transactional connections. The platform's Magic Nodes feature extends this further, using pattern recognition to surface relationships between wallets that have never directly interacted, a capability the team has positioned as AI-assisted anomaly detection as it has matured through 2025 and 2026.

BMT itself is deployed natively on two chains — BNB Chain (BEP-20) and Solana (SPL) — with the two deployments connected via LayerZero's cross-chain messaging protocol, enabling token transfers and interoperability between ecosystems rather than requiring users to choose one chain exclusively. This dual-chain approach mirrors the platform's own multi-chain analytics coverage, letting the token's liquidity and utility follow users across whichever ecosystem they are actively investigating.

Core Components

Component	Function
Bubble Map Engine	Core visualization converting wallet holdings and transfers into interactive bubble graphs
Magic Nodes	Behavioral clustering revealing indirect wallet relationships and coordinated groups
Time Travel	Historical distribution playback to track how token concentration changed over time
Intel Desk	Community governance layer for proposing, voting on, and funding investigations
Cross-Chain Layer (LayerZero)	Connects BNB Chain and Solana BMT deployments for unified token utility

Because Bubblemaps' value proposition rests on data accuracy and the credibility of its clustering conclusions, the platform's methodology (how Magic Nodes infers indirect relationships, and how false positives are handled) is a meaningful technical detail for due diligence, best verified directly against wiki.bubblemaps.io.

■ SECTION 04

Tokenomics & Allocation

BMT has a fixed max supply of 1,000,000,000 tokens. As of this report's data pull, circulating supply stood at 727.68M BMT (roughly 72.8% of max supply) — a notably high circulating ratio for a token roughly 17 months post-launch, with unlocked market cap (\$17.56M) essentially matching total market cap (\$17.54M), indicating almost all currently counted supply is genuinely liquid. The remaining gap to fully diluted valuation (\$24.11M) is comparatively modest at roughly 1.4x current market cap — meaningfully lower dilution risk than most projects in this coverage series.

Allocation Breakdown

Allocation Category	% of Supply
Airdrop	22.17%
Ecosystem	21.30%
Liquidity	12.18%
Team	9.00%
Seed	6.98%
Protocol	6.00%
Early Backers	5.73%
Private	5.63%
Binance IDO	4.00%
Binance HODLer Airdrop	3.00%
Binance Marketing	3.00%
Strategic	1.00%

BMT's allocation stands out for its unusually low combined Team allocation (9.00%) relative to most projects in this coverage series, where team allocations of 15–26% are common — a structure that limits insider sell pressure specifically. Combined Seed, Early Backers, Private, and Strategic allocations total roughly 19.3%, a moderate but not excessive investor stake. Bubblemaps uses cliff vesting for its Airdrop allocation specifically, meaning that category releases all at once after a waiting period rather than gradually — the next scheduled unlock (to Ecosystem) was slated for August 18, 2026, worth monitoring as a near-term supply event relative to this report's date.

■ SECTION 05

Funding & Investors

Bubblemaps raised approximately \$3.20M in disclosed seed funding, led by INCE Capital with participation from Momentum 6, Stake Capital Group, Founderheads, Daxos Capital, Majinx Capital, and v3ntures. This is a comparatively

modest raise relative to other projects in this coverage series, consistent with Bubblemaps' organic, investigation-led growth strategy that built reputation prior to significant capital deployment.

Investor Tiers

Tier	Notable Backers	Type
Tier 3	IBC Ventures, ChainGPT Labs	Venture / Incubator
Tier 4	INCE Capital (Lead), Momentum 6, Stake Capital Group, Founderheads, Daxos Capital, Majinx Capital, v3ntures	Venture
Other	Avalanche Foundation, LBank, Cronos Labs	Corporation
Other	Nicolas Bacca, Owen Simonin, Dyma Budorin	Angel Investor

The presence of several blockchain foundations (Avalanche Foundation, Cronos Labs) as investors rather than purely financial backers suggests strategic interest in Bubblemaps' analytics capabilities from underlying chain ecosystems themselves — a validation signal distinct from typical venture capital participation. Angel investors including Nicolas Bacca (Ledger co-founder) add further credibility from established figures in blockchain security and infrastructure.

SECTION 06

Team

Bubblemaps' core leadership team is fully named and publicly disclosed, with all three co-founders maintaining public professional profiles. Founder and CEO Nicolas Vaiman previously worked at Cryptonavia prior to founding Bubblemaps in 2022.

Name	Role
Nicolas Vaiman	Co-Founder & CEO
Arnaud Droz	Co-Founder & COO
Leo Pons	Co-Founder & CTO
Cecilien	CMO
Tomer Warschauer Nuni	Strategic Advisor

Two of three co-founders (Vaiman, Droz) maintain both Twitter/X and LinkedIn profiles under their real names, while CTO Leo Pons has a LinkedIn and public GitHub presence — a strong transparency signal for the technical leadership specifically. The CMO's public identity uses a stylized cartoon avatar and single name ("Cecilien"), a common pattern for marketing-focused roles in crypto-native teams that does not detract from the otherwise fully disclosed founding team.

SECTION 07

Market Performance & Liquidity

BMT's 24-hour trading range at the time of this report spanned \$0.01619 to \$0.02755, with the token up sharply (+47–50%) across nearly every major exchange in the same session — one of the largest uniform single-day moves

seen across this coverage series. This scale of move, combined with reported commentary elsewhere describing a 228% BMT surge alongside open interest reaching \$15 million, points to a specific news catalyst (likely tied to a high-profile Bubblemaps investigation or exchange integration) rather than routine market volatility, though the precise trigger was not independently confirmed in this report's source material.

Exchange Liquidity (24h volume by venue)

Exchange	Pair	24h Volume	Price	24h %
Binance TR	BMT/TRY	\$43.78M	\$0.02429	+49.7%
Binance	BMT/USDT	\$37.45M	\$0.02428	+49.4%
Lbank	BMT/USDT	\$10.07M	\$0.02428	N/A
Gate	BMT/USDT	\$4.03M	\$0.02422	+47.6%
Bybit	BMT/USDT	\$3.53M	\$0.02424	+49.8%
Bitget	BMT/USDT	\$2.83M	\$0.02420	+47.5%
Binance	BMT/USDC	\$1.86M	\$0.02436	+50.0%
BingX	BMT/USDT	\$1.46M	\$0.02417	+47.4%
Kraken	BMT/USD	\$1.37M	\$0.02413	+4.37%
DigiFinex	BMT/USDT	\$1.03M	\$0.02417	+47.6%
MEXC	BMT/USDT	\$911.23K	\$0.02421	+48.5%
KuCoin	BMT/USDT	\$596.64K	\$0.02405	+47.4%

Binance venues (main spot plus Binance TR) together dominate visible liquidity, representing well over half of total reported 24h volume — a reasonable reflection of Binance's role as BMT's original IDO and Web3 Wallet integration partner. Kraken's comparatively muted +4.37% move against the near-uniform +47–50% seen elsewhere is a minor anomaly worth noting, though it does not change the overall picture of a broad, exchange-wide rally.

■ SECTION 08

Ecosystem & Competitive Landscape

Ecosystem Traction

- Binance integrated Bubblemaps directly into its Web3 Wallet in October 2025, letting users visualize wallet clusters and token distributions natively within the wallet interface — a major exchange partnership embedding Bubblemaps' utility into a large existing user base.
- Bubblemaps V2 launched publicly in May 2025, introducing advanced tools for detecting insider activity and mitigating memecoin-related scams, expanding the platform's capability beyond its original V1 toolset.
- The platform's public investigations continue to generate real-world impact and visibility: recent examples include flagging a token as "50% bundled" behind hidden wallets on X (reaching 276K followers), and revealing connected wallets that earned \$320,000 from prediction-market bets tied to politically sensitive events.
- The team's public roadmap has targeted enhanced cross-chain analytics, AI-powered pattern recognition for anomaly detection, and specialized DeFi protocol visualization tools through 2025 and into 2026, with stated intent to

expand exchange and portfolio-management-app partnerships further.

Competitive Landscape

Bubblemaps competes in the on-chain analytics category alongside tools like Nansen, Arkham Intelligence, and traditional block explorers offering increasingly sophisticated labeling and clustering features. Bubblemaps' specific differentiation is its visual-first, accessibility-focused approach — explicitly designed to lower the barrier to entry for non-expert users rather than serving primarily institutional or highly technical audiences. Its public track record of high-profile, widely-shared investigations (SHIB, various memecoin bundling cases) has also built organic brand recognition that is difficult for newer entrants to replicate quickly.

■ SECTION 09

Roadmap & Outlook

Bubblemaps' publicly stated roadmap has followed a staged expansion: Q1 2025 saw the BMT token launch and Intel Desk introduction; Q2 2025 focused on enhanced cross-chain analytics; Q3 2025 targeted AI integration for pattern recognition; and Q4 2025 aimed at specialized DeFi protocol visualization tools. The team's stated 2026-onward priority is expanding partnerships with major exchanges and portfolio management applications, building on the precedent set by the Binance Web3 Wallet integration.

- Watch for additional exchange or wallet integrations beyond Binance, which would meaningfully expand Bubblemaps' embedded distribution similar to the October 2025 Web3 Wallet partnership.
- Watch for the August 18, 2026 Ecosystem unlock and subsequent scheduled releases, given BMT's use of cliff vesting for select allocation categories that can create concentrated unlock events.
- Watch for continued high-profile public investigations, since these have historically served as organic marketing and price catalysts for BMT (as reflected in this report's featured price action).
- Watch for expansion of AI-based clustering accuracy and any published methodology transparency, given that the platform's core value depends on the credibility of its pattern-detection conclusions.

■ SECTION 10

Bullish Case, Bearish Case & Risk Factors

▲ BULLISH CASE

▼ BEARISH CASE

+ Genuine, demonstrated real-world utility with a strong public track record (SHIB whale cluster, NFT wash trading, memecoin bundling exposés) built before and reinforced after the token launch. + Major exchange distribution via the October 2025 Binance Web3 Wallet integration, embedding Bubblemaps' analytics directly into a massive existing user base. + Comparatively low FDV-to-market-cap gap (~1.4x) and high circulating supply ratio (~73% of max supply), reducing near-term dilution risk relative to most projects in this coverage series. + Unusually low Team allocation (9%) limits insider-specific sell pressure, and the presence of blockchain foundations (Avalanche, Cronos) as investors signals ecosystem-level strategic interest. + Fully named, publicly disclosed founding team with real professional track records, including a Ledger co-founder as an angel investor.	– Token trades roughly 92% below its all-time high, reflecting a severe, sustained drawdown despite genuine platform utility and growth. – The featured near-uniform +47-50% single-day rally across exchanges appears driven by a specific news catalyst not independently confirmed in available sources, and such sharp moves can reverse quickly once the catalyst fades. – Competes against well-funded, more institutionally-focused analytics platforms (Nansen, Arkham Intelligence) that may have deeper resources for AI/ML development. – Platform credibility depends entirely on clustering and pattern-detection accuracy; false positives or methodology disputes could damage trust built through its public investigation track record. – Cliff-vesting structure for Airdrop and select allocations creates concentrated unlock events (e.g., the August 18, 2026 Ecosystem unlock) rather than smoother linear distribution.
---	--

Key Risk Factors

Risk Factor	Severity	Description
Post-ATH Drawdown	High	BMT trades roughly 92% below its all-time high despite continued platform development and exchange integrations.
Rally Sustainability	Medium	The featured 47-50% single-day rally's underlying catalyst was not independently confirmed and may not persist.
Methodology / Accuracy Risk	Medium	Platform value depends on clustering and Magic Nodes accuracy; false positives could undermine credibility.
Competitive Pressure	Medium	Nansen, Arkham Intelligence, and evolving native explorer features compete directly in on-chain analytics.
Cliff Vesting Concentration	Medium	Airdrop and select allocations use cliff vesting, creating concentrated rather than smooth unlock events.
Exchange Dependency	Low	A meaningful share of liquidity and utility distribution currently concentrates around Binance-related venues and integrations.
Macro / Crypto Beta	Medium	As a small-cap altcoin, BMT remains correlated with broader crypto market cycles despite its niche utility focus.

■ SECTION 11

Investment Potential and Risks

Bubblemaps stands out in this coverage series for having built genuine, demonstrable utility and public credibility before its token existed — a track record of real investigations (SHIB, NFT wash trading, ongoing memecoin bundling exposés) that most token launches cannot claim. Its tokenomics are also comparatively conservative: a low Team allocation, a modest FDV-to-market-cap gap, and a high circulating supply ratio all reduce near-term dilution risk relative to typical projects in this series, while the October 2025 Binance Web3 Wallet integration gave it meaningful, low-friction distribution.

Against that, the ~92% drawdown from all-time highs is a stark reminder that genuine utility and credible team execution do not automatically translate into sustained token price performance — a pattern also seen with Falcon Finance elsewhere in this coverage series. The featured sharp rally in this report's snapshot data is notable but should be treated cautiously until its underlying catalyst and durability are better understood, and the platform's long-term value ultimately rests on continued accuracy and credibility of its clustering methodology rather than any single price move.

NBZ RESEARCH VERDICT

Rating: MODERATE RISK — Credible Utility, Verify Rally Catalyst

Bubblemaps combines a rare, already-proven utility case with conservative tokenomics and strong exchange distribution, but the token's price history shows that fundamentals alone have not been sufficient to prevent a severe drawdown from highs. The sharp rally captured in this report's data warrants attention but not overconfidence absent clearer confirmation of its cause and staying power. NBZ Research views BMT as one of the more fundamentally credible small-cap assets in this coverage series on a utility basis, suited to investors specifically interested in the on-chain-analytics thesis who are prepared to treat recent price action as a data point to investigate further rather than a standalone signal to act on.

This report reflects publicly available information as of the stated date and is not financial advice. DYOR. Token unlock schedules and roadmaps are subject to change — verify against wiki.bubblemaps.io and bubblemaps.io.
