\$DOS · Institutional Research Report

A Web3 AI Operating System that converts natural-language user intent into executed on-chain actions — evaluated across technology, tokenomics, funding, market performance, ecosystem traction, and forward-looking risk.

TICKER	SECTOR	CHAIN	REPORT DATE
DOS	Web3 AI Operating System	Ethereum (ERC-20)	August 2026

■ SECTION 01

Project Overview

DappOS (styled dappOS, ticker DOS) is a Web3 AI Operating System that lets users research, plan, and execute crypto-related tasks from a single natural-language interface. Rather than manually managing wallets, gas, and cross-chain routing, users state an intended outcome and the system interprets that intent, maps it to an on-chain execution path, and returns a finished result — a document, deployed contract, strategy, or completed transaction.

The project evolved from an earlier intent-centric execution network into a broader AI operating layer for Web3, and now positions its flagship product, xBubble, as a low-prompt AI agent aimed at solo founders, traders, and "one-person companies" who need Web3-native output without writing code. Ahead of its DOS token generation event, the team reported having processed over 12 million on-chain operations across more than 5 million users, giving it an operating track record most projects at token launch do not have.

\$0.2410 PRICE (SNAPSHOT)	\$48.26M MARKET CAP	\$241.34M FULLY DILUTED VALUATION	#336 MARKET RANK	~-2% 24H MOVE (MARKETS)
---	---	---	--	---

Snapshot

Metric	Value
Token Ticker	DOS
Category	Web3 AI Operating System / Intent Execution Network
Circulating Supply	200.00M DOS
Total Supply / Max Supply	1.00B DOS
24h Trading Volume	\$247.24M
All-Time High	\$0.7128
All-Time Low	\$0.1000
Token Generation Event (TGE)	August 10, 2026
Website	dappos.com
Whitepaper / Docs	dappos.gitbook.io/docs

DOS is a very recently launched token — TGE occurred on August 10, 2026, roughly a week before this report's data pull — so all market figures should be read as early-stage, high-volatility snapshots rather than settled trading patterns.

■ SECTION 02

Problem & Solution

The Problem

Using Web3 productively still requires users to understand wallets, gas fees, bridging, chain selection, and dApp-specific interfaces before they can act on a single idea. That complexity locks out non-technical users and slows even experienced ones, while forcing every application team to rebuild the same account-abstraction and cross-chain plumbing independently.

The Solution

- **Intent-centric execution** — users describe a desired outcome in plain language rather than constructing transactions manually; the system decomposes that intent into an executable, verifiable on-chain plan.
- **Chain and account abstraction** — gas handling, key management, and cross-chain routing are hidden from the end user, building on earlier account- and chain-abstraction infrastructure the team developed before layering AI on top.
- **Intelligence Layer** — a Multi-Agent Framework of roughly 300–400 specialized agents and over 200 integrated tools, powered by a continuously learning "Bubble Engine" that ingests signals from sources such as X and Binance Square.
- **Execution Layer (Intent Execution Network / IEN)** — a distributed system using an Optimistic Minimum Staking mechanism across a three-phase workflow (counterparty matching, execution, verification) to turn AI-generated plans into verifiable on-chain actions.
- **xBubble** — the consumer-facing product surface, turning short prompts into finished outputs: documents, deployed contracts, research, or completed on-chain strategies.

■ SECTION 03

Technology & Architecture

DappOS's architecture is split into two cooperating layers. The Intelligence Layer runs the multi-agent framework responsible for interpreting user intent, researching context, and generating an execution plan; it is described as continuously learning from external data sources rather than operating on a static model. The Execution Layer — the Intent Execution Network — is a distributed settlement system responsible for turning that plan into verified, on-chain reality.

The IEN's Optimistic Minimum Staking mechanism requires counterparties (solvers/executors) to stake collateral against the actions they commit to perform, with a three-phase flow of counterparty matching, execution, and post-hoc verification. This design is broadly similar in spirit to other intent-based and solver-network architectures in Web3 (e.g., intent settlement layers used elsewhere in the industry), where economic bonding rather than pure trust secures execution quality.

Core Components

Component	Function
Intelligence Layer	Multi-agent framework (~300–400 agents, 200+ tools) that interprets intent and plans execution
Bubble Engine	Continuously learning engine that builds task-specific standard operating procedures (SOPs)
Intent Execution Network (IEN)	Distributed execution layer using Optimistic Minimum Staking to verify on-chain actions
xBubble	Consumer product surface converting prompts into finished Web3 outputs

Because so much of the system's value depends on the reliability of AI-generated plans and the economic security of its solver network, technical diligence should focus on audit history of the IEN staking/verification contracts and on how failures or disputes between counterparties are resolved in practice — details best confirmed directly against

dappos.gitbook.io/docs.

■ SECTION 04

Tokenomics & Allocation

DOS has a fixed total/max supply of 1,000,000,000 tokens, deployed on Ethereum. At TGE, only about 20% of total supply entered circulation, and that unlock was drawn entirely from the Ecosystem, Treasury, Marketing, and Airdrop allocations — 0% of Team or Investor tokens unlocked at launch. As of this report's data pull, circulating supply stood at 200.00M DOS against an unlocked market cap of \$51.78M and a fully diluted valuation of \$241.34M, meaning roughly 80% of max supply remains locked or vesting.

Allocation Breakdown

Allocation Category	% of Supply
Investors	22.50%
Ecosystem	20.00%
Treasury	20.00%
Team	20.00%
Marketing	11.50%
Airdrop	6.00%

Vesting Schedule

Category	Unlock Terms
Team	0% at TGE; 12-month cliff, then linear vesting over 48 months
Investors	0% at TGE; 12-month cliff, then linear vesting over 48 months
Ecosystem	5% at TGE, 3.5% over the following 12 months, remainder over 48 months
Treasury	9% at TGE, 2% over the following 12 months, remainder over 48 months
Marketing	3% at TGE, remainder vesting over 48 months post-lock-up

The headline insider allocation (Team + Investors = 42.5% of supply) is high relative to many recent launches, but the structure meaningfully de-risks the first year: team and investor tokens cannot unlock at all until 12 months post-TGE, and are not fully unlocked until 60 months out. That keeps near-term sell pressure concentrated in ecosystem, treasury, and marketing categories rather than insiders — a materially more conservative design than allocations with immediate insider unlocks.

■ SECTION 05

Funding & Investors

DappOS raised \$20.50M at a \$300.00M valuation across a broad, multi-tier investor syndicate anchored by Polychain Capital and HashKey Capital, with additional participation from YZi Labs (formerly Binance Labs), HSG, OKX Ventures,

Mirana Ventures, Amber Group, and KuCoin Labs, among others.

Investor Tiers

Tier	Notable Backers	Type
Tier 1	Polychain Capital (Lead), HashKey Capital, YZi Labs (formerly Binance Labs)	Venture / Incubator
Tier 2	HSG (Lead), OKX Ventures, Mirana Ventures, Amber Group, KuCoin Labs	Venture / Exchange
Tier 3	NGC Ventures, Waterdrip Capital, Foresight Ventures, Gate.io, Symbolic Capital, Chain Capital, Bitrise Capital, UpHonest Capital	Venture / Exchange

A \$300M valuation against a \$20.5M raise implies investors bought in around 6.8% of fully diluted equity value — a rich valuation by early-stage standards, but one that reflects DappOS's pre-TGE operating history (millions of users, tens of millions of processed transactions) rather than a pre-product raise. The presence of both Polychain and YZi Labs (Binance's incubator arm) as lead-tier backers is a notable signal of institutional conviction.

SECTION 06

Launch, Listings & Distribution

DOS's tokenomics were formally announced on July 29, 2026, with the token generation event following on August 10, 2026. Rather than a single exchange debut, the team coordinated a simultaneous multi-venue launch spanning centralized exchanges, an airdrop claim portal, and Binance's Alpha discovery track.

Date	Milestone
Jul 29, 2026	DOS tokenomics officially announced (supply, allocation, vesting, utility)
Aug 2, 2026	Airdrop registration window closed
Aug 5, 2026	Claim Portal live; Phase 1 airdrop eligibility checking opened
Aug 10, 2026 — 09:00 UTC	Binance Alpha features DOS; MEXC lists DOS/USDT and DOS/USDC in Innovation Zone
Aug 10, 2026 — 10:00 UTC	Community airdrop claim window opens (6% of total supply)
Aug 10, 2026 — 11:00 UTC	Bitget lists DOS/USDT with an accompanying Launchpool
Aug 10–24, 2026	MEXC Airdrop+ event (deposit, spot, and futures challenges)

This coordinated cross-exchange launch (Binance Alpha, MEXC, Bitget, plus DEX venues) gave DOS unusually broad day-one liquidity access for a new token. Early trading was notably flat rather than volatile at listing, which can reflect either balanced positioning going into launch or a market that had already priced in the well-telegraphed tokenomics ahead of time.

SECTION 07

Market Performance & Liquidity

As a token roughly one week old at the time of this report, DOS does not yet have a meaningful multi-period price history. Available data shows a 24-hour trading range of \$0.2260–\$0.2490, with the token trading well below its brief

all-time high of \$0.7128 and modestly above its all-time low of \$0.1000 — both effectively set within days of launch, a pattern typical of newly listed tokens finding their initial trading range.

Exchange Liquidity (24h volume by venue)

Exchange	Pair	24h Volume	Price	24h %
PancakeSwap	DOS/USDT	\$58.00M	\$0.2410	N/A
Uniswap V4	DOS/USDC	\$31.35M	\$0.2350	N/A
OKX	DOS/USDT	\$6.20M	\$0.2415	-1.79%
KuCoin	DOS/USDT	\$4.63M	\$0.2409	-1.87%
Bitget	DOS/USDT	\$4.06M	\$0.2396	-2.64%
MEXC	DOS/USDT	\$3.68M	\$0.2408	-1.97%
Uniswap V3	DOS/USDT	\$2.98M	\$0.2416	N/A
Lbank	DOS/USDT	\$2.09M	\$0.2424	N/A
Gate	DOS/USDT	\$1.89M	\$0.2410	-1.83%

Total visible 24h volume (\$247.24M) is unusually large relative to the \$48.26M market cap — a turnover ratio above 5x — which is common in the first days after a coordinated multi-exchange launch with airdrop and Launchpool incentives driving activity, but is not sustainable as a steady-state liquidity profile. DEX volume (PancakeSwap and Uniswap combined) currently makes up the clear majority of trading, ahead of any single centralized exchange.

SECTION 08

Ecosystem & Competitive Landscape

Ecosystem Traction

- Pre-token operating history: over 12 million on-chain operations processed across more than 5 million users prior to TGE, per the project's disclosures.
- Two-product structure: xBubble (general AI agent for solo founders/creators) and the Web3 AI OS (crypto-native research, planning, and execution).
- The Bubble Engine's continuous learning from platforms like X and Binance Square is positioned as a differentiator versus static-model competitors, though this claim is difficult to independently verify without direct access to the system.

Competitive Landscape

DappOS sits at the intersection of two categories: intent-based execution / chain-abstraction infrastructure (competing conceptually with projects like Connex, Particle Network, and other intent-settlement layers) and the newer wave of "AI agent" crypto products promising natural-language control over on-chain activity. Both categories are crowded and rapidly evolving in 2026, and the durable winners are likely to be determined by execution reliability and real usage rather than narrative alone — an area where DappOS's pre-launch user and transaction counts give it a genuine, if team-reported and not independently audited, head start over pure-narrative competitors.

SECTION 09

Roadmap & Outlook

With TGE only recently completed, DappOS's near-term roadmap priorities are best tracked directly through official channels (dappos.com, dappos.gitbook.io/docs) rather than third-party aggregators, given how fast token-specific details (staking parameters, governance activation, fee-discount mechanics) are likely to evolve in the weeks after launch.

- Watch for staking activation details — DOS is intended to be used for staking, fee discounts, premium subscriptions, and governance, but specific parameters (APY, lock periods) had not been fully detailed in public sources as of this report.
- Watch for the first post-cliff Ecosystem/Treasury/Marketing unlock milestones, since these categories carry ongoing linear vesting even though Team and Investor tokens remain fully locked for the first 12 months.
- Watch for expanded exchange listings beyond the initial Binance Alpha / MEXC / Bitget / DEX cohort, and for any Tier-1 exchange spot listing (e.g., full Binance spot) which would meaningfully change the liquidity and legitimacy profile.

■ SECTION 10

Bullish Case, Bearish Case & Risk Factors

▲ BULLISH CASE	▼ BEARISH CASE
+ Rare combination for a token launch: genuine pre-TGE product usage (12M+ operations, 5M+ users) rather than a pre-product raise. + Strong, multi-tier institutional backing led by Polychain Capital and HashKey Capital, with YZi Labs (Binance's incubator) also participating. + Conservative token-release structure: 0% Team/Investor unlock at TGE with a full 12-month cliff, reducing near-term insider sell pressure versus many comparable launches. + Broad, coordinated day-one exchange distribution (Binance Alpha, MEXC, Bitget, major DEXs) gave DOS unusually deep liquidity access immediately at launch. + Positions at the intersection of two well-funded 2026 narratives — intent-based chain abstraction and AI agents — giving it multiple potential demand drivers.	– Extremely limited trading history (about one week old at time of writing) makes any performance assessment preliminary and unreliable. – High combined Team + Investor allocation (42.5% of supply) represents a large overhang once the 12-month cliff ends, even though vesting is gradual thereafter. – 24h volume-to-market-cap ratio above 5x at launch reflects incentive-driven activity (airdrop, Launchpool) that is unlikely to persist and may mask true organic demand. – "AI agent" and "intent execution" claims are difficult for outside observers to independently verify; performance and reliability data comes primarily from the team itself. – Crowded competitive field in both underlying categories (chain abstraction and AI-agent crypto tooling), with no established leader yet in either.

Key Risk Factors

Risk Factor	Severity	Description
Early-Stage Volatility	High	Token is roughly one week old; price discovery is incomplete and historical patterns are not yet meaningful.

Risk Factor	Severity	Description
Token Overhang	Medium	42.5% combined Team/Investor allocation unlocks starting at the 12-month cliff, then vests over 48 months.
Unverified Usage Claims	Medium	Pre-TGE user/transaction figures are team-reported and not independently audited by a third party in available sources.
Solver / IEN Security	Medium	Execution relies on an Optimistic Minimum Staking mechanism; contract audit history and dispute-resolution track record should be verified directly.
Competitive Crowding	Medium	Both chain-abstraction and AI-agent crypto categories are crowded with well-funded entrants in 2026.
Incentive-Driven Volume	Medium	Elevated launch-week volume is likely inflated by airdrop and Launchpool incentives rather than organic steady-state demand.
Macro / Crypto Beta	High	As a small/mid-cap altcoin, DOS is highly correlated with broader crypto market cycles.

■ SECTION 11

Investment Potential and Risks

DappOS enters the market with a stronger-than-typical foundation for a fresh token launch: real pre-TGE usage numbers, a top-tier investor syndicate led by Polychain Capital and HashKey Capital, and a token-release structure that meaningfully delays insider selling pressure relative to many 2026 launches. The coordinated, multi-venue exchange debut also gave it liquidity access most new tokens take months to build.

Against that, DOS is genuinely unproven as a traded asset — barely a week of price history exists, current volume is almost certainly inflated by launch incentives, and the project's core AI-agent and intent-execution claims rest largely on team-reported figures rather than independently verified data. The 42.5% combined Team/Investor allocation, while responsibly gated behind a 12-month cliff, remains a real medium-term overhang investors should track closely as that date approaches in 2027.

NBZ RESEARCH VERDICT

Rating: EARLY-STAGE / WATCH LIST — Insufficient Trading History for Conviction Call

DappOS combines an unusually credible pre-launch operating history and strong VC backing with all the standard risks of a token that is barely days old. The conservative vesting structure (zero insider unlock at TGE, 12-month cliff) is a genuine positive that separates this launch from weaker-designed peers, but current trading data is too thin and incentive-driven to support a high-conviction call in either direction. NBZ Research places DOS on a watch list pending several weeks of organic (non-airdrop) trading data and clarity on staking/governance activation, and flags the 12-month cliff date as the single most important calendar risk to monitor going forward.

This report reflects publicly available information as of the stated date and is not financial advice. DYOR. Token unlock schedules and roadmaps are subject to change — verify against dappos.gitbook.io/docs.
