

AIOZ NETWORK

AIOZ · DePIN for AI, Storage & Streaming

Rank #288 | Market Cap \$61.33M | DePIN / AI Infrastructure

AIOZ / USD

REPORT SCOPE

Project Overview · Technology & Architecture · Tokenomics · Team & Governance
Market Performance · Ecosystem & Adoption · Competitive Landscape
Bullish / Bearish Analysis · Risk Assessment · Roadmap · Investment Potential

SECTION 01

Project Overview

AIOZ Network is a Decentralized Physical Infrastructure Network (DePIN) built to combine AI compute, decentralized storage, content pinning, and peer-to-peer video streaming into a single infrastructure layer. Rather than competing in one narrow vertical, AIOZ positions itself as a full-stack alternative to centralized cloud and CDN providers, allowing individual node operators to contribute bandwidth, storage, and compute in exchange for AIOZ token rewards.

The network launched its mainnet in 2021 and runs on a hybrid architecture that blends a Cosmos SDK-based blockchain layer with Ethereum compatibility, enabling cross-chain asset movement and smart contract support alongside its DePIN service layer. The core product suite is organized under four pillars: AIOZ Storage (S3-compatible object storage), AIOZ Stream (P2P video delivery), AIOZ Pin (decentralized content pinning), and AIOZ AI (distributed AI compute and model hosting).

RANK #288	MARKET CAP \$61.33M	PRICE ~\$0.048	CIRCULATING SUPPLY 1.27B	ALL-TIME HIGH \$2.667
---------------------------------	---	--------------------------------------	--	---

According to the project's own network statistics, AIOZ has reported over 326,000 active nodes distributing more than 26,000 TB of data at various points in 2026, positioning it among the larger node networks in the DePIN sector by raw participation count.

SECTION 02

Technology & Architecture

AIOZ's architecture is built around a dual-layer design: a Cosmos SDK blockchain handling consensus, staking, and governance, paired with a decentralized service layer that handles the actual storage, streaming, and compute workloads. This separation allows the chain layer to focus on security and coordination while the service layer focuses on throughput and real-world usability.

Core Product Pillars

- **AIOZ Storage** — S3-compatible, decentralized object storage designed as a drop-in alternative to centralized cloud storage for developers.
- **AIOZ Stream** — Peer-to-peer video streaming and transcoding infrastructure, including newer features such as multilingual video summaries.
- **AIOZ Pin** — Decentralized content pinning, primarily used for NFT metadata and asset persistence, addressing centralized storage dependency risk in NFT ecosystems.
- **AIOZ AI** — A distributed AI compute and model layer, now in its 'V2' stage, hosting community model challenges (e.g. image classification, tabular prediction) and publishing peer-reviewed research (ICRA 2026, CVPR 2026).

Recent Technical Milestones

- **Hardfork v1.8 (February 2026)** — Upgraded the core Cosmos SDK to v0.53, improving cross-chain interoperability and network stability.
- **Vision Paper V2 (January 2026)** — Outlined a unified DePIN layer strategy tying storage, streaming, pinning, and AI compute into one coordinated system.
- **Testnet Faucet (February 2026)** — Lowered onboarding friction for developers testing on AIOZ infrastructure.

The consensus mechanism is a delegated proof-of-stake (DPoS) model, chosen for its ability to support higher transaction throughput relevant to media-heavy workloads compared to less specialized general-purpose chains.

SECTION 03

Tokenomics

AIOZ token allocation is structured to weight the majority of supply toward long-term ecosystem incentives rather than short-term insider liquidity, with the Ecosystem bucket representing over half of total token allocation.

Allocation	% of Supply	Tokens
Ecosystem	53%	~673.1M AIOZ
Team	25%	~317.5M AIOZ
Marketing	5%	~63.5M AIOZ
Advisors	5%	~63.5M AIOZ
Liquidity	3%	~38.1M AIOZ
Private / Pre-sale	5.74%	73.00M AIOZ
Public Sale	1.34%	16.99M AIOZ

Initial vs. Current Values

Metric	At Token Sale	Current
Market Cap	\$603.75K	\$61.33M
Fully Diluted Market Cap	\$19.08M	\$61.33M
Circulating Supply	40.25M AIOZ	1.27B AIOZ
Total Supply	1.27B AIOZ	1.27B AIOZ

One notable structural point: total and circulating supply are now identical at 1.27B AIOZ, meaning the token is effectively fully unlocked and there is no reported maximum supply cap ('--' on max supply), which places the long-term inflation schedule in the hands of ongoing emissions policy rather than a hard ceiling. Separately, third-party trackers report AIOZ's node-reward inflation rate scheduled to fall to roughly 5% in 2026, a step down that would reduce sell pressure from operator rewards if realized as described.

SECTION 04

Team & Governance

AIOZ Network's leadership team is publicly identified, with named founders, core technical leads, and external advisors — a transparency baseline that reduces (but does not eliminate) anonymity-related risk relative to fully pseudonymous projects.

Name	Role	Notes
Erman Tjiputra	Founder / CEO	Public-facing; frequently quoted in official communications and press coverage (MIT Tech Review, TechCrunch).
Trieu Nguyen	CTO	Leads core technical architecture.
Hien Nguyen	Head of Blockchain	Oversees chain-layer development.
Quang Tran	Head of AI	Leads AIOZ AI research and product, tied to published research (ICRA, CVPR).
Dave Peacock	Head of Design	Product and brand design lead.
Laura Toma	Advisor	External advisory role.
Joshua Toh	Advisor	External advisory role.
Dejan Horvat	Advisor	External advisory role.

Founder Erman Tjiputra has publicly framed the project's mission as building "a people-powered internet where anyone can contribute storage, bandwidth, and compute," a framing consistent with the DePIN positioning reflected across the product suite.

Team allocation sits at 25% of total supply — on the higher end relative to some DePIN peers — which warrants monitoring of any disclosed vesting schedule, though granular unlock-date data was not available in the sources reviewed for this report.

SECTION 05

Market Performance

24H -0.24%	7D +2.99%	30D -3.03%	90D -27.52%	YTD -47.02%
---------------	--------------	---------------	----------------	----------------

Metric	Value
24h Low / High	\$0.04762 / \$0.05093
Market Cap	\$61.33M
Fully Diluted Market Cap	\$61.33M
24h Volume	\$2.29M
All-Time High	\$2.667
All-Time Low	\$0.01105
Market Dominance	<0.01%
Rank	#288

AIOZ trades roughly 98% below its all-time high, reflecting the broad drawdown across small- and mid-cap DePIN tokens since the 2021–2022 cycle peak rather than an AIOZ-specific event. The token has recovered materially off its all-time low of \$0.01105, and short-term (7-day) momentum has been positive even as medium-term (90-day, YTD) trends remain negative — consistent with a project in early-stage accumulation rather than an established uptrend.

Exchange-level developments cited in third-party coverage include AIOZ's addition to Bitvavo's Flex staking program (March 2026, ~1.4% APY with no lock-up) and reported strong buy-side activity on Coinbase, both of which point to expanding retail accessibility rather than confirmed institutional flow.

SECTION 06

Ecosystem & Adoption

Through the first half of 2026, AIOZ Network's public monthly reports show a consistent product-shipping cadence across its four pillars rather than a single flagship launch.

- **January 2026** — Vision Paper V2 released; coverage in MIT Technology Review and TechCrunch on the unified DePIN thesis.
- **February 2026** — Hardfork v1.8 shipped; Testnet Faucet launched for developer onboarding; HackerNoon feature on AIOZ Storage.
- **April 2026** — AIOZ Stream added multilingual video summaries (English, Hindi, Chinese); new AI models added spanning voice, image, and animation workflows.
- **May 2026** — AIOZ AI expanded its public challenge series (tabular prediction, medical imaging/melanoma classification).
- **June 2026** — AIOZ AI Research presented at ICRA 2026 (aerial robotics scene synthesis) and CVPR 2026 (3D affordance learning), indicating a genuine academic research function alongside the commercial product.

Reported integrations cited by third-party sources include Kova Network and NakamotoGames building on AIOZ infrastructure, alongside partnership references to Conflux, Neo Blockchain, and WINKLink oracle infrastructure — though the depth and revenue impact of these integrations were not independently verifiable from the sources reviewed.

By early-2026 network statistics, AIOZ reported operating in excess of 30,000 active nodes across more than 100 countries, with later self-reported figures citing over 326,000 nodes and 26,000+ TB of data delivered — a wide range across sources that likely reflects different counting methodologies (unique node operators vs. total node instances) and should be treated as directional rather than precise.

SECTION 07

Competitive Landscape

AIOZ's core differentiator is scope: most DePIN competitors specialize in a single vertical, while AIOZ bundles storage, streaming, pinning, and AI compute into one node-operator experience.

Competitor	Primary Focus	Positioning vs. AIOZ
Filecoin (FIL)	Decentralized storage	Single-vertical storage leader; larger market cap but reportedly weaker storage-economics efficiency per some analyst commentary.
Arweave (AR)	Permanent storage	Focused on permanent data archival rather than active/streaming workloads.
Theta Network (THETA)	Video streaming/CDN	Single-vertical streaming competitor; historically higher valuation multiples than AIOZ.
Livepeer (LPT)	Video transcoding	Transcoding-specific infrastructure; smaller node/operator footprint reported vs. AIOZ.
Render (RNDR)	Decentralized GPU/AI compute	Competes with AIOZ AI specifically; more established in GPU rendering use cases.
Bittensor (TAO)	Decentralized AI compute	Broader AI-compute mindshare; different incentive/subnet model than AIOZ AI.

The trade-off of AIOZ's multi-service breadth is execution complexity: competing credibly in storage, streaming, and AI simultaneously requires a larger and more diverse node network than any single-purpose rival needs, and AIOZ must also contend with centralized incumbents (AWS, Google Cloud, Microsoft Azure) that could introduce hybrid decentralized offerings of their own.

SECTION 08

Bullish & Bearish Analysis

BULLISH FACTORS

- ▲ Full-stack DePIN model (storage + streaming + AI compute) offers broader utility surface than single-vertical peers.
- ▲ Consistent monthly shipping cadence across four product pillars through H1 2026 rather than a single roadmap milestone.
- ▲ Genuine academic research output (ICRA 2026, CVPR 2026 papers) is uncommon among DePIN peers and may support long-term technical credibility.
- ▲ Reported node count growth and geographic spread (100+ countries) suggest real operator participation, not purely speculative token holding.
- ▲ Trades at a fraction of prior all-time high with token largely de-risked from further large unlock events given fully circulating supply.

BEARISH FACTORS

- ▼ Down ~47% year-to-date and ~27.5% over 90 days — medium-term price trend remains negative despite recent 7-day strength.
- ▼ No maximum supply cap disclosed, leaving long-term dilution dependent on emissions policy rather than a hard ceiling.
- ▼ Competes simultaneously against better-capitalized single-vertical leaders (Filecoin, Theta, Render, Bittensor) across every one of its four verticals.
- ▼ Node count figures vary substantially across sources (30K vs. 326K), indicating a lack of a single authoritative, verifiable metric.
- ▼ Team allocation (25%) is relatively high; specific vesting/unlock schedule was not available in reviewed sources.

SECTION 09

Risk Assessment

Risk Factor	Category	Severity	Mitigating Context
Competitive displacement	Market	High	AIOZ competes against better-funded, single-focus leaders in every vertical it operates in (storage, streaming, AI compute).
Token inflation / dilution	Tokenomics	Medium	No disclosed max supply; reported inflation step-down to ~5% in 2026 is a mitigating but externally-sourced claim.
Metric verification	Data integrity	Medium	Wide variance in self-reported node counts (30K–326K) across periods/sources makes usage claims difficult to independently verify.
Regulatory uncertainty	Regulatory	Medium	Utility-token classification and DePIN reward structures remain subject to evolving global crypto regulation.
Enterprise adoption bottleneck	Adoption	Medium	Reported enterprise/dApp integrations (Kova Network, NakamotoGames) are limited in disclosed scale and revenue contribution.
General market volatility	Market	High	Small-cap altcoins with sub-\$100M market caps are highly correlated to broader crypto market cycles and liquidity conditions.

This risk assessment is based on publicly available information as of the report date and should not be treated as exhaustive. Independent due diligence is recommended before any investment decision.

SECTION 10

Roadmap & Future Outlook

AIOZ's publicly stated direction, per its Vision Paper V2 and monthly reports through mid-2026, centers on three continuing priorities: deepening developer accessibility, strengthening core DePIN infrastructure, and expanding real-world application surface area across AI, storage, and streaming.

- Continued AIOZ AI 'V2' expansion — more model challenges, broader model hosting, and continued academic research output.
- Further cross-chain interoperability work building on the Hardfork v1.8 / Cosmos SDK v0.53 upgrade.
- Expansion of enterprise-facing storage and streaming features, positioning AIOZ Storage as a practical S3-compatible alternative for builders.
- Continued ecosystem partnership growth (oracle infrastructure, gaming, cross-chain projects) though disclosed partnership depth remains limited.

Some third-party analysts frame 2026-2027 as a pivotal window for enterprise-focused DePIN feature deployment broadly, citing projections that decentralized CDN infrastructure could capture a meaningful share of the global CDN market later in the decade — a sector-wide thesis that would benefit AIOZ if it executes, but is not a guarantee specific to this project.

SECTION 11

Investment Potential & Risks

AIOZ Network presents a differentiated bet within the DePIN sector: rather than competing narrowly, it aggregates storage, streaming, pinning, and AI compute under one node-operator and token-incentive model. That breadth is simultaneously its main structural advantage and its main execution risk — it must build credible depth across four verticals where dedicated single-purpose competitors already have a head start.

The token's price has fallen sharply from its 2021 all-time high, in line with the broader DePIN sector correction, and remains down double digits over the trailing year even as short-term momentum has turned modestly positive. Investors considering AIOZ are effectively underwriting continued multi-vertical product execution, sustained node-operator participation, and eventual enterprise adoption converting into durable token demand — none of which are yet fully proven at scale based on the sources reviewed.

NBZ RESEARCH VERDICT

AIOZ Network is a legitimate, actively-shipping DePIN infrastructure project with a credible team, real product surface area across storage, streaming, and AI, and a token structure that is now fully circulating with no further large unlock overhang. The multi-vertical strategy is ambitious and differentiated, but it places AIOZ in direct competition with better-capitalized, single-focus leaders across every service it offers. This profile fits a higher-risk, higher-conviction small-cap DePIN allocation rather than a core holding — position sizing and independent verification of usage metrics are strongly advised. This is not financial advice.
