BSQUARED NETWORK

\$B2 · Institutional Research Report

A Bitcoin Layer-2 rollup network combining zero-knowledge proof verification with EVM compatibility — evaluated across technology, tokenomics, funding, market performance, ecosystem traction, and forward-looking risk.

TICKER	SECTOR	CHAIN	REPORT DATE
B2	Bitcoin Layer-2 / ZK-Rollup	Bitcoin-secured, EVM-compatible	August 2026

SECTION 01

Project Overview

Bsquared Network (B2) is a Bitcoin Layer-2 scaling solution designed to expand Bitcoin's utility beyond passive value storage into an active settlement and application layer. The network was among the first to implement a Zero-Knowledge Proof Verification Commitment (ZPVC) Rollup anchored to Bitcoin, pairing zero-knowledge proofs with EVM compatibility so developers can deploy Ethereum-style smart contracts while inheriting Bitcoin's base-layer security.

The project's stated mission is to restore the builder culture of early Bitcoin development by making it straightforward for EVM-native teams to migrate DApps onto Bitcoin rails, while giving BTC holders productive uses for otherwise idle capital through staking, DeFi, and — most recently — an "agentic AI" settlement layer where autonomous software agents transact using Bitcoin-secured infrastructure.

Snapshot

Metric	Value
Token Ticker	B2
Category	Bitcoin Layer-2, ZK-Rollup, EVM-compatible
Circulating Supply	67.35M B2
Total Supply	207.44M B2
Max Supply	210.00M B2
24h Trading Volume	\$3.08M
All-Time High	\$2.121 (Oct 2025)
All-Time Low	\$0.3091 (Jul 2026)
Website	bsquared.network
Whitepaper / Docs	docs.bsquared.network

SECTION 02

Problem & Solution

The Problem

Bitcoin remains the most secure and liquid blockchain network, but its base layer processes roughly seven transactions per second and lacks native smart-contract expressiveness. That leaves over a trillion dollars of BTC largely idle — usable as a store of value but not as productive, programmable capital — while builders wanting Bitcoin-grade security

have historically had to choose wrapped-asset bridges or sidechains with weaker security assumptions.

The Solution

- **B² Rollup** — a ZK-Rollup execution layer that batches transactions off-chain and posts succinct proofs back to Bitcoin, lifting throughput to the hundreds of transactions per second via its Transaction Bundler service.
- **B² Hub** — described as a Layer-1.5 data availability and verification layer that can service multiple Bitcoin rollups, positioning B2 as shared settlement infrastructure rather than a single isolated chain.
- **EVM compatibility** — full support for Ethereum-style tooling and addresses alongside native Bitcoin addresses, intended to let existing EVM DApps redeploy on Bitcoin with minimal rework.
- **BTC Yield & Buzz** — staking and "mining rig" mechanics that let BTC, ETH, and other assets earn yield while contributing to network security and liquidity.
- **Agentic AI infrastructure** — a newer pivot positioning B2 as a settlement rail for AI-to-AI commerce, where autonomous agents hold wallets and transact using Bitcoin-secured rails.

SECTION 03

Technology & Architecture

B2's architecture separates execution from settlement. The Rollup Layer runs a ZK-Rollup based on a zkEVM design, executing user transactions and batching state changes into zero-knowledge proofs. Those proofs, together with compressed transaction data, are committed back to the Bitcoin base layer — using Taproot-based anchoring — so the security of the rollup ultimately traces back to Bitcoin's proof-of-work consensus rather than to a separate validator set.

Above the rollup sits B² Hub, described by the team as the Bitcoin ecosystem's first shared data availability layer, intended to let multiple Bitcoin Layer-2 projects verify and store data through a common layer rather than each building bespoke infrastructure. The network reports transaction confirmation times as fast as roughly 150 milliseconds at the Hub layer, alongside dual address-format support (Bitcoin and Ethereum-style) so users and developers from either ecosystem can interact directly.

Core Components

Component	Function
B ² Rollup	ZK-Rollup execution layer; zkEVM-based transaction processing
B ² Hub	Layer-1.5 data availability & verification layer for Bitcoin rollups
B ² Buzz	Multi-asset staking event (BTC, ETH, BNB, Polygon) feeding ecosystem incentives
MiningSquared	Native staking / mining-rig mechanism used to distribute B2 rewards

This design trades some of the decentralization purity of Bitcoin's base layer for programmability and speed — a trade-off common across all Bitcoin L2 architectures, and one investors should weigh against competing designs (see Section 8).

SECTION 04

Tokenomics & Allocation

B2 has a hard-capped max supply of 210,000,000 tokens. As of this report's data pull, circulating supply stood at 67.35M B2 (~32% of max supply), while total supply already minted or accounted for reached 207.44M — meaning the large majority of tokens exist but remain locked, vesting, or held in ecosystem reserves rather than freely tradable. This

gap between market cap (\$32.52M) and fully diluted valuation (\$101.40M) is the single most important tokenomics fact for prospective holders.

Allocation Breakdown

Allocation Category	% of Supply
Ecosystem Reserve	24.00%
Staking (HIVE)	20.00%
Public Distribution	11.99%
Bitcoin Extensive Networks Incentive	11.00%
Investors	10.00%
Team + Advisors	10.00%
Ecosystem Incentive — BUZZ I	5.50%
Ecosystem Incentive — BUZZ II	5.00%
Initial Liquidity Provision	2.00%
Ecosystem Incentive — Testnet Odyssey	0.50%

Combined, Investors and Team + Advisors account for 20% of total supply — a moderate insider allocation by industry norms, though the 44% sitting in Ecosystem Reserve and Staking pools warrants attention: how and when those tokens enter circulation will materially affect sell-side pressure over the network's first several years. Prospective holders should track official vesting disclosures on docs.bsquared.network rather than relying on any single third-party snapshot.

SECTION 05

Funding & Investors

B² Network closed a seed round in January 2024 backed by a broad syndicate of exchange-affiliated and crypto-native venture funds, including HashKey Capital, OKX Ventures, IDG Capital, KuCoin Ventures, ABCDE, Waterdrip Capital, Satoshi Lab, OGs Fund, Antalpha Group, and Leland Ventures. The cap table has since broadened across additional tiers to include The Spartan Group and Alliance DAO as lead investors, alongside Animoca Brands, Cypher Capital, Skyland Ventures, Candaq, TPC, FutureMoney Group, and Maxx Capital.

Investor Tiers

Tier	Notable Backers	Type
Tier 1	The Spartan Group (Lead), HashKey Capital	Venture
Tier 2	P2 Ventures (Lead), Alliance (Lead), OKX Ventures, KuCoin Ventures	Venture / Incubator
Tier 3	Animoca Brands (Lead), Waterdrip Capital, Cypher Capital, ABCDE, Skyland Ventures	Venture
Tier 4	IDG Capital, Candaq, Antalpha Global, TPC, FutureMoney Group, Maxx Capital	Venture

The presence of three separate "Lead" designations across tiers (Spartan Group, P2 Ventures/Alliance, Animoca Brands) suggests multiple financing rounds rather than a single event, consistent with the network's roughly two-year runway from seed funding to full token generation.

SECTION 06

Team

Publicly listed core team members operate under first-name / handle identities rather than full disclosed legal names, which is common in crypto-native teams but reduces transparency relative to projects with fully doxxed leadership.

Name	Role
Arwen	CEO
Desmond	Operation Lead
Nonoo	Ecosystem Lead

Investors should treat the team's pseudonymous public presentation as a governance and due-diligence consideration rather than a disqualifying flag on its own — many well-capitalized, exchange-backed Bitcoin L2 projects retain partially pseudonymous leadership while still passing institutional VC diligence, as reflected in B2's investor roster.

SECTION 07

Market Performance & Liquidity

Price Performance

Period	Change
24 Hours	-3.92%
7 Days	+3.11%
30 Days	-11.15%
90 Days	-23.63%
Year-to-Date	-38.89%

B2 is trading roughly 78% below its October 2025 all-time high of \$2.121, and closer to its July 2026 all-time low near \$0.309–\$0.310 than to prior highs — a drawdown broadly consistent with the wider small/mid-cap altcoin market over the same window, though the scale of decline underscores this remains an early-stage, high-volatility asset.

Exchange Liquidity (24h volume by venue)

Exchange	Pair	24h Volume	Price	24h %
PancakeSwap	B2/WBNB	\$1.00M	\$0.4826	N/A
Bitget	B2/USDT	\$170.26K	\$0.4811	-4.22%

Exchange	Pair	24h Volume	Price	24h %
Gate	B2/USDT	\$166.67K	\$0.4829	-3.80%
DigiFinex	B2/USDT	\$115.67K	\$0.4840	-4.60%
MEXC	B2/USDT	\$68.48K	\$0.4815	-4.18%
BingX	B2/USDT	\$66.27K	\$0.4816	-4.06%
KuCoin	B2/USDT	\$61.04K	\$0.4825	-3.67%
BYDFi	B2/USDT	\$51.23K	\$0.4813	-4.21%
Lbank	B2/USDT	\$25.97K	\$0.4836	N/A

Liquidity is fragmented across roughly a dozen venues with no single exchange dominating flow — the largest venue by volume (PancakeSwap, a DEX) still represents under a third of visible 24h turnover. B2 has also secured listings on larger centralized venues including Kraken (October 2025), Bitget (June 2025), and KuCoin as a "World Premiere" listing (April 2025), which meaningfully expanded accessibility versus the token's earliest trading days.

■ SECTION 08

Ecosystem, Partnerships & Competitive Landscape

Ecosystem Traction

- B² Buzz, the network's flagship staking/incentive program, has attracted over \$543M in deposited assets historically, the large majority denominated in BTC.
- The team has cited over 500,000 users and more than 5,000 BTC attracted through its staking products, alongside integrations with Babylon, Aptos, Core DAO, Sei, and Echo.
- Native \$B2 staking went live in May 2025, offering yield on both the B² mainnet and BNB Chain while granting governance rights over protocol parameters such as fee adjustments and upgrades.

Competitive Landscape

Bsquared Network competes in the crowded Bitcoin Layer-2 category alongside projects such as Merlin Chain, BEVM, Rootstock (RSK), and Core DAO, all pursuing similar goals of adding programmability and yield to BTC while preserving some link to Bitcoin's security guarantees. Differentiation in this category tends to come down to (a) genuine security anchoring versus marketing claims, (b) developer and DApp adoption, and (c) exchange and liquidity access — areas where B2's VC backing and exchange listings (including Kraken) give it a relatively strong starting position, but where no Bitcoin L2 has yet established durable category dominance.

■ SECTION 09

Roadmap & Recent Developments

Date	Milestone
Jan 2024	Seed round closed (HashKey Capital, OKX Ventures, IDG Capital, and others)
Apr 30, 2025	KuCoin "World Premiere" listing; \$B2 token generation event (TGE)
May 26, 2025	Native \$B2 staking launched on B ² Mainnet and BNB Chain

Date	Milestone
Jun 10, 2025	Bitget listing (Innovation & Public Chain Zone)
Jul 2 – Aug 2, 2025	"B2 Rush Month" ecosystem campaign, \$100K prize pool
Jul 29, 2025	Indodax listing (Indonesian retail access)
Oct 7, 2025	Kraken spot listing
Apr 30, 2026	First TGE anniversary; "B ² 2048" long-term roadmap unveiled, framing Bitcoin as settlement infrastructure for the AI era
Jun–Jul 2026	Scheduled network maintenance upgrades (routine infrastructure improvements)

The "B² 2048" vision, announced around the token's first anniversary, signals a multi-decade framing for the project and a deliberate pivot toward AI-agent commerce narratives — a strategy that broadens the addressable narrative but also adds execution risk, since AI-native Bitcoin settlement is an unproven use case rather than an established market.

■ SECTION 10

Bullish Case, Bearish Case & Risk Factors

▲ BULLISH CASE	▼ BEARISH CASE
+ Credible, well-capitalized investor base spanning multiple funding tiers, including exchange-affiliated funds (HashKey, OKX, KuCoin) and established Web3 VCs (Animoca Brands, Spartan Group, IDG Capital). + Demonstrated exchange traction, including a Kraken listing — one of the more selective major venues — plus KuCoin, Bitget, Gate, MEXC, and others. + Meaningful reported user and capital traction through B² Buzz staking (500K+ users, 5,000+ BTC, \$500M+ historically deposited). + Expanding narrative surface area (Bitcoin DeFi, data availability layer for other rollups, AI-agent settlement) that could attract new capital if any one thesis gains traction.	– Only about 32% of max supply is in circulation versus a fully diluted valuation over 3x the current market cap — a substantial future dilution overhang as reserves and staking allocations unlock. – Token price down roughly 39% year-to-date and about 78% from its October 2025 all-time high, reflecting weak sustained demand versus supply growth. – Crowded, undifferentiated competitive field (Merlin Chain, BEVM, Rootstock, Core DAO) all pursuing similar Bitcoin-L2 theses. – Pseudonymous core team (first names / handles only) limits public accountability relative to fully doxxed teams. – Newer "agentic AI" positioning is a narrative pivot without proven product-market fit, adding execution uncertainty on top of existing L2 competition.

Key Risk Factors

Risk Factor	Severity	Description
Token Dilution	High	~68% of max supply is not yet circulating; reserve, staking, and incentive unlocks could pressure price over time.

Risk Factor	Severity	Description
Competitive Displacement	Medium	Multiple well-funded Bitcoin L2s pursue overlapping theses; no clear category leader has emerged.
Team Transparency	Medium	Publicly listed leadership uses first names/handles rather than full disclosed identities.
Narrative Dependency	Medium	Recent pivot toward AI-agent settlement is unproven and could fail to gain adoption.
Liquidity Fragmentation	Medium	Trading volume is spread thin across many small venues; large orders may face slippage.
Smart Contract / Rollup Security	Medium	ZK-Rollup and bridge infrastructure carry inherent smart-contract and cryptographic implementation risk common to all L2s.
Macro / Crypto Beta	High	As a small/mid-cap altcoin, B2 is highly correlated with broader crypto market cycles and Bitcoin price action.

■ SECTION 11

Investment Potential and Risks

Bsquared Network sits in one of crypto's more credible growth narratives — putting Bitcoin's roughly two-trillion-dollar asset base to productive use — backed by a genuinely strong investor syndicate and real exchange distribution, including a Kraken listing that few small-cap tokens achieve. That combination gives B2 more institutional credibility than the median Bitcoin L2 competitor.

Against that, the token's economics currently work against near-term holders: less than a third of max supply is circulating, the fully diluted valuation sits more than triple the market cap, and price has fallen sharply from its highs even as the team ships new features and campaigns. The project's long-term investment case depends heavily on whether B² Rollup, B² Hub, and its newer AI-settlement narrative can convert existing capital and user traction into durable, revenue-generating DApp activity — rather than staking-driven TVL alone — before scheduled unlocks meaningfully expand supply.

NBZ RESEARCH VERDICT

Rating: SPECULATIVE / HIGH RISK — Watch List

Bsquared Network offers legitimate technological ambition and unusually strong institutional backing for a sub-\$50M market cap Bitcoin L2, but current tokenomics create real near-to-medium-term dilution risk that has already been reflected in an ~78% drawdown from all-time highs. This is a speculative, high-volatility position suited only to investors who have done independent diligence on the vesting schedule, understand Bitcoin L2 competitive dynamics, and can tolerate significant drawdown risk. NBZ Research does not consider this a core holding at current supply dynamics, and flags it as a watch-list asset pending clearer evidence of DApp-driven (non-staking) demand.
