RESEARCH BY NBZ / NASIR

Market data as of August 15-16, 2026 · Not financial advice

01PROJECT OVERVIEW

FIELD	DETAIL
Project Name	ETHGas
Token Ticker	GWEI
Blockchain Layer	Not a standalone L1 or L2 — an out-of-protocol infrastructure and marketplace layer sitting atop Ethereum L1
Built On	Ethereum; economic security sourced via EigenLayer restaking (cited at over \$10B TVL through the "EigenLayer Vision AVS")
Protocol Type	Blockspace futures market and preconfirmation infrastructure — the project calls this "Realtime Ethereum"
Founded	Founded by Kevin Lepsoe; Blockspace Futures Market launched December 2025
HQ	Hong Kong
TGE Date	January 13, 2026 (GWEI governance token launch, alongside the "Genesis Harvest" community distribution campaign)
Contract Address	Not independently confirmed in sources reviewed for this report
Website	ethgas.com / docs.ethgas.com
Total Raised	\$12M seed round (December 2025), led by Polychain Capital; separately, \$800M in liquidity/builder commitments (not equity or token investment)
Circulating Supply	1.75B GWEI (≈17.5% of max supply)
Max Supply	10.00B GWEI
Current Focus	Blockspace Futures Market, Inclusion/Execution Preconfirmations, Open Gas Initiative, the \$3B multi-year Ether.fi partnership

ETHGas is infrastructure built around a specific, well-recognized limitation of Ethereum: 12-second block times and an unpredictable, auction-based gas market that forces users and applications to bid blindly for transaction inclusion. Rather than proposing a new base layer, ETHGas builds a marketplace on top of Ethereum that turns blockspace itself — the right to have a transaction included and executed — into a structured, tradable financial asset, similar in spirit to how commodity or interest-rate futures let traditional market participants hedge and plan around volatile prices.

The core products are Inclusion Preconfirmations (guaranteed placement of a transaction within a specific future block, typically for a fixed amount of gas), Execution Preconfirmations (guaranteed state outcomes, still in active development), Whole Block Commitments (primary and secondary markets for entire blocks), and Base Fee Futures (calendar-based gas price hedging with cash settlement). Collectively, ETHGas frames this as letting institutions "hedge gas exposure the same way airlines hedge fuel costs," while validators convert unpredictable MEV revenue into contracted, recurring income.

ETHGas is a genuinely new entrant: its Blockspace Futures Market launched in December 2025, its GWEI governance token launched barely a month later in January 2026, and it had already secured a \$12M Polychain-led seed round and \$800M in ecosystem liquidity commitments before the token existed. This compressed timeline reflects both strong early institutional interest and the fact that, as of this report, GWEI has only a few months of trading history to evaluate.

02TEAM & FOUNDERS

NAME	ROLE	BACKGROUND
Kevin Lepsoe	Founder & CEO	20+ years in traditional finance derivatives and structuring; led Financial Engineering and Structuring at Morgan Stanley; held structured credit and rates roles at Barclays Capital; began his career at ING Barings in Hong Kong and Singapore; also held risk-management experience connected to JPMorgan. A serial entrepreneur, he previously founded Web2 companies Chinafy and Notey Labs, and the DeFi protocol Infinity Exchange. Graduated University of British Columbia (Math and Finance, 2000). Based in Hong Kong.
Rosanna Man	CTO	Listed as ETHGas's CTO with a LinkedIn profile; detailed public biographical and prior-work information is limited in sources reviewed for this report relative to the CEO's extensively documented background.

Kevin Lepsoe's background is unusually well-matched to ETHGas's specific product thesis: building a "blockspace futures market" is fundamentally a derivatives-structuring problem, and two decades spent structuring credit, rates, and derivatives products at Morgan Stanley, Barclays, and ING Barings is directly relevant domain expertise rather than a general tech or crypto-trading background. His prior venture (Infinity Exchange, a DeFi fixed-income protocol) also suggests continuity of focus on bringing TradFi financial-engineering concepts on-chain rather than a founder pivoting opportunistically into a new narrative.

The public documentation gap around CTO Rosanna Man is worth noting directly: for a protocol whose core value proposition depends on sophisticated real-time settlement infrastructure (preconfirmations delivered in milliseconds, per the project's own claims), the technical leadership's public track record is comparatively thin relative to the CEO's. This does not necessarily indicate a problem, but it is a genuine transparency gap for prospective holders evaluating engineering execution risk independent of the CEO's clearly strong financial-engineering credentials.

Overall, ETHGas's team profile is a genuine outlier among crypto infrastructure projects: a founder with directly relevant, extensively documented TradFi derivatives pedigree, paired with limited independently verifiable information about the rest of the technical organization.

03 TECHNOLOGY & ARCHITECTURE

COMPONENT	DESCRIPTION
Inclusion Preconfirmations	Guaranteed transaction placement within a specific future block for a fixed gas amount (typically 200,000 gas units); ETHGas claims this reduces effective confirmation time from Ethereum's ~12-second block time to roughly 3 milliseconds
Execution Preconfirmations	Guaranteed state outcomes (transaction executes at a specific price/blockchain state), positioned as an active development priority for 2026
Whole Block Commitments	Primary and secondary markets for entire blocks, enabling bulk blockspace purchasing
Base Fee Futures	Calendar-based gas price hedging instruments with cash settlement
Economic Security	Secured via EigenLayer restaking through the "EigenLayer Vision AVS," cited at over \$10B in TVL (this figure's precise scope — whether specific to ETHGas or reflecting broader EigenLayer AVS activity — was not independently disaggregated in sources reviewed)
Open Gas Initiative	Industry program abstracting gas fees from end-user experience via protocol-funded rebates; live on Ethereum mainnet with stated plans to expand to BNB Chain, Base, and Arbitrum
Agentic Settlement	x402 agentic preconfirmations, aimed at settling AI-agent-driven transactions in realtime
Smart Contract Audits	No specific, named third-party security audit of ETHGas's own contracts or infrastructure was identified in sources reviewed for this report

In plain terms, ETHGas is trying to do for Ethereum blockspace what financial futures markets did for commodities: replace last-minute, high-anxiety bidding with the ability to lock in price and access ahead of time. Instead of every user and application blindly competing in Ethereum's public mempool during a 12-second window, ETHGas lets buyers purchase guaranteed inclusion or execution outcomes in advance, and lets validators sell their future blockspace forward for predictable, contracted revenue instead of relying entirely on volatile, session-by-session MEV extraction.

The technical approach sits within a broader, actively-developing category of Ethereum "preconfirmation" research alongside proposer-builder separation (PBS) evolution, and ETHGas explicitly positions its model as complementary to, rather than a replacement for, existing block-building infrastructure like Flashbots' MEV-Boost. The reliance on EigenLayer restaking for economic security ties ETHGas's security assumptions to the broader restaking ecosystem's own risk profile, an important dependency to note for anyone evaluating the protocol's underlying trust model.

The most material technology-risk gap is the absence of a specific, named third-party security audit for ETHGas's own infrastructure in the sources available for this report. Given that the protocol handles real-time settlement commitments with direct financial value, this is a meaningful diligence item, particularly for a project only months removed from its token launch.

04USE CASES & REAL-WORLD APPLICATIONS

USE CASE	DESCRIPTION	STATUS
Validator Revenue (Blockspace Forward-Selling)	Validators and node operators sell future blockspace forward, converting volatile MEV into contracted, recurring revenue	Live
Institutional Settlement Certainty	Onchain transacting with settlement guarantees, fair ordering, compliance controls, and known/onshore validators	Live (targeted)
Blockspace Trading	Traders and searchers buy preconfirmations for guaranteed inclusion and trade blockspace as an asset class	Live
Protocol/dApp Integration	Building on "100ms Realtime Blocks" for instant, reliable execution	Early / expanding
Wallet & Order Flow Integration	Reserved capacity and guaranteed settlement for instant transactions with predictable gas, via the Open Gas Initiative	Live
Agent-Driven Settlement	x402 agentic preconfirmations for AI-agent transaction settlement	Roadmap
Retail Gas Rebates	Users reclaim a share of gas spent through Open Gas rebates	Live

The most concrete, large-scale proof point to date is the three-year, \$3B partnership with Ether.fi to build an institutional forward market for Ethereum blockspace — a genuinely significant, named commitment from an established liquid-restaking protocol, rather than a speculative pilot. Combined with the reported \$800M in broader liquidity commitments from Ethereum ecosystem builders ahead of the token launch, ETHGas has secured unusually large-scale institutional interest for a protocol still in its first year of live operation.

The Open Gas Initiative is ETHGas's clearest consumer-facing utility driver: by allowing participating protocols to offer gas rebates funded through the ETHGas system, it creates a direct incentive for other applications to integrate ETHGas infrastructure, expanding the addressable base of gas-fee-sensitive users beyond crypto-native traders.

Execution Preconfirmations and agent-driven x402 settlement remain the least mature parts of the roadmap as of this report; the protocol's more advanced financial products (whole-block commitments, base-fee futures) are live in some form but their actual trading volume and real institutional usage were not independently quantifiable from sources reviewed.

05COMMUNITY & ECOSYSTEM

METRIC	DATA
Pre-TGE User Base	283,000+ users reported prior to the January 2026 token launch
Liquidity Commitments	\$800M in commitments from Ethereum ecosystem builders, announced alongside the December 2025 seed round
Flagship Institutional Partnership	Three-year, \$3B forward-market partnership with Ether.fi
Other Named Integrations	EigenLayer, Pendle, Velvet Capital
Launch Campaign	"Genesis Harvest" community distribution, with an eligibility snapshot taken January 19, 2026
Exchange Listings	Bitget, Coinbase (spot and futures, from February 2026), KuCoin, LBank, Hotcoin, Gate, Bitunix, BingX, MEXC
24h Trading Volume	≈\$10.7M (Aug 2026), against a \$40.5M market cap

ETHGas's ecosystem signals lean heavily institutional and infrastructure-focused rather than retail-community-driven: its highest-profile relationships are with other protocols (Ether.fi, EigenLayer, Pendle) and market participants (Susquehanna, Keyrock as investors) rather than a large social-media-native community, which is broadly consistent with its positioning as financial infrastructure for validators, institutions, and builders rather than a consumer application.

The Coinbase listing timeline (added to the listing roadmap February 11, 2026, futures trading the same day, spot trading roughly two weeks later) is a meaningful, fast-tracked institutional validation signal — achieving full Coinbase spot support within about a month of being added to the roadmap, and roughly six weeks after TGE, is an unusually quick progression relative to most new tokens.

Trading volume relative to market cap (roughly 26% of market cap traded in 24 hours as of this report) is high, which can reflect either genuine active price discovery for a newly-listed token or elevated speculative churn; at this stage of the token's life, distinguishing between the two is difficult from available data alone.

06INVESTORS & PARTNERSHIPS

ROUND	DATE	AMOUNT	LEAD / NOTES
Seed Round	December 2025 (announced Dec 17)	\$12M	Led by Polychain Capital
Ecosystem Liquidity Commitments	December 2025	\$800M	Non-equity commitments from Ethereum builders to support the Blockspace Futures Market; not a capital raise

TIER	INVESTOR	TYPE
Tier 1	Polychain Capital (Lead)	Venture
Tier 2	Amber Group	Venture
Tier 3	BlueYard Capital	Venture
Tier 4	Stake Capital Group	Venture
Tier 4	Node Capital	Venture
Tier 4	Tokka Labs	Venture
Other	Susquehanna	Corporation (major TradFi market maker)
Other	Keyrock	Corporation (market maker)
Other	BTCS	Corporation (publicly traded crypto infrastructure company)

ETHGas's investor roster is notable for blending crypto-native venture capital (Polychain, Amber Group, BlueYard) with established traditional-finance market-making firms (Susquehanna, Keyrock) as strategic backers rather than pure financial investors. Susquehanna in particular is one of the largest options and derivatives market makers in traditional finance, and its direct involvement lends real credibility to ETHGas's core thesis of bringing derivatives-market structure to Ethereum blockspace — a strategic backer whose own business would plausibly benefit from and validate the product category.

The \$12M seed round is relatively modest in absolute size compared to some infrastructure projects, but the accompanying \$800M in liquidity commitments (distinct from equity capital) suggests ETHGas prioritized securing market-making and liquidity partners over raising a larger primary funding round — a reasonable strategy for a marketplace protocol whose value depends heavily on having liquid, active counterparties from day one.

The Ether.fi partnership, structured as a three-year, \$3B forward-market building commitment rather than a simple integration announcement, is the single most consequential named partnership in ETHGas's history to date and should be weighted heavily in any institutional-credibility assessment.

07TOKENOMICS

PARAMETER	VALUE
Ticker	GWEI
Token Type	Governance token for the ETHGas protocol
Max / Total Supply	10,000,000,000 GWEI
Circulating Supply	1.75B GWEI (≈17.5% of max supply)
TGE Date	January 13, 2026
Governance Rights	Oversight of protocol parameter changes, upgrades, and treasury decisions; supports vote delegation without token transfer

CATEGORY	TOTAL %	UNLOCKED	LOCKED
Ecosystem	31%	1.55%	29.4%
Investors	27%	0%	27% (2.70B GWEI)
Team	22%	0%	22%
Community	10%	1.25%	8.75%
Foundation	8%	8%	0% (fully unlocked)
Advisors	2%	0%	2%

GWEI's tokenomics show a very early-stage unlock profile: only about 17.5% of max supply is currently circulating, and critically, the two largest insider-facing buckets — Investors (27%) and Team (22%), together 49% of total supply — are entirely locked as of this report, with zero percent unlocked in either category. This is a substantially larger proportion of un-vested insider allocation than most of the other tokens in this research series carry at a comparable point post-TGE.

The Foundation allocation (8%) is the only category fully unlocked at this stage, which is typical for funding early operational and ecosystem-development activity immediately post-launch. The Ecosystem (31%) and Community (10%) buckets have both begun releasing (1.55% and 1.25% unlocked respectively) but the vast majority of even these more community-oriented allocations remains locked.

The practical implication is significant: as the Investors and Team allocations begin vesting (the specific cliff and linear-release schedule for these buckets was not fully detailed in sources reviewed), nearly half of GWEI's total supply will progressively enter circulation, representing substantial future dilution pressure relative to the token's current, still-small circulating base. This is the single most important structural factor for anyone evaluating GWEI's medium-term price risk.

08 MARKET OVERVIEW

METRIC	VALUE
Current Price	\$0.0223–\$0.02743 (24h range, Aug 15–16, 2026)
Market Cap	\$40.48M
Fully Diluted Market Cap	\$231.36M
Market Cap / FDV Ratio	≈0.17 — very low, reflecting the large proportion of supply not yet circulating
24h Volume	\$10.70M
All-Time High	\$0.2491 (near TGE, January 2026)
All-Time Low	\$0.01275
Market Cap Rank	#385 (CMC app) / #349 (CryptoRank) — rank varies modestly by provider
Circulating Supply	1.75B GWEI (≈17.5% of max supply)
Recent 24h Exchange Moves	Approximately -13.6% to -14.7% reported across major exchanges (Bitget, Coinbase, KuCoin, Gate, BingX, MEXC) as of this report

GWEI's price history to date is short but has already been volatile. The token reached its all-time high of roughly \$0.249 close to its January 2026 TGE — a pattern common to new token launches with concentrated initial demand — and has since declined substantially, currently trading around \$0.023, roughly 91% below that high and only modestly above its all-time low of \$0.01275.

Third-party market commentary as recently as early-to-mid August 2026 explicitly described GWEI as being in a "deep pullback," with traders described as "torn between its innovative blockspace thesis and brutal price reality" — language that reflects a genuine tension between the project's well-regarded technical and institutional narrative and its weak observed price performance since launch.

The extremely low market-cap-to-FDV ratio (≈0.17) is the most important context for interpreting GWEI's current valuation: today's roughly \$40M market cap reflects only the circulating 17.5% of supply, while the fully diluted value of nearly \$231M implies the market is pricing in substantial future dilution. Any price recovery thesis needs to account for how the market will absorb the large, currently-locked Investor and Team allocations as they begin vesting.

09COMPETITORS & MARKET POSITION

PROJECT	TYPE	POSITIONING VS. ETHGAS
Flashbots (MEV-Boost)	Open-source, free proposer-builder separation (PBS) infrastructure	The dominant, deeply entrenched incumbent standard for Ethereum block-building; free and open-source, which is a structural challenge for any commercial, fee-based alternative like ETHGas to compete against directly
Primev (mev-commit)	Peer-to-peer execution-commitment network	A direct competitor in the preconfirmation category, using a P2P model where order-flow originators specify execution intents to providers who are rewarded or slashed for compliance
Espresso Systems	BFT-backed preconfirmations	A different technical approach to preconfirmations, backed by a subset of L1 validators under BFT consensus guarantees rather than ETHGas's marketplace/futures model
Ethereum Protocol-Native Gas Futures (Vitalik Buterin proposal)	Proposed trustless, on-chain gas futures market	A potential long-term existential risk rather than a direct commercial competitor: in December 2025, Ethereum co-founder Vitalik Buterin publicly proposed a trustless, protocol-native gas futures market, which, if built directly into Ethereum's core protocol, could reduce demand for ETHGas's out-of-protocol commercial equivalent

ETHGas competes in a genuinely crowded and fast-evolving corner of Ethereum infrastructure. Flashbots' MEV-Boost is the single biggest competitive reality: it is free, open-source, and already the de facto standard used by the overwhelming majority of Ethereum validators, meaning ETHGas must demonstrate clear, additive value (predictable forward pricing, institutional-grade settlement guarantees) rather than simply better execution of the same basic function.

Primev and Espresso represent more direct philosophical competitors within the specific preconfirmation category, each with different trust and security models (P2P commitment-and-slashing versus BFT validator-subset consensus, versus ETHGas's marketplace/futures framing). None of these approaches has yet established itself as the clear category winner, meaning the preconfirmation space remains genuinely contested as of this report.

The most distinctive and consequential competitive risk is not a company but an idea: Vitalik Buterin's own December 2025 proposal for a trustless, on-chain gas futures market suggests Ethereum's core development community sees real merit in ETHGas's basic thesis — which validates the problem ETHGas is solving, but also raises a genuine long-term question about whether a protocol-native solution could eventually reduce the need for ETHGas's commercial, out-of-protocol offering.

10RECENT NEWS & UPDATES

DATE	EVENT
2024–2025	Core infrastructure development and early capital-raising by founder Kevin Lepsoe, building on his TradFi derivatives-structuring background
December 2025	ETHGas launches the first Blockspace Futures Market for Ethereum
December 17, 2025	\$12M seed round announced, led by Polychain Capital, alongside \$800M in ecosystem liquidity commitments
December 2025	Vitalik Buterin publicly proposes a trustless, on-chain gas futures market for Ethereum — notable validation of, and potential long-term competition for, ETHGas's core thesis
January 13, 2026	GWEI governance token officially launches via TGE, alongside the "Genesis Harvest" community distribution campaign
January 19, 2026	Eligibility snapshot taken for the initial GWEI community distribution
January 23, 2026	"Proof of Pain" airdrop coverage and blockspace futures market analysis published (BlockEden.xyz)
February 11, 2026	GWEI added to Coinbase's listing roadmap; Coinbase Futures trading begins the same day
~Late February 2026	Coinbase opens GWEI spot trading, roughly two weeks after the futures listing
2026 (ongoing)	Three-year, \$3B partnership with Ether.fi to build an institutional blockspace forward market progresses
2026 (ongoing)	Open Gas Initiative continues onboarding protocol partners, with stated plans to expand beyond Ethereum mainnet to BNB Chain, Base, and Arbitrum
Early-Mid August 2026	Market commentary (CoinMarketCap AI) describes GWEI in a "deep pullback," highlighting tension between the project's blockspace thesis and weak price performance

The timeline shows an unusually fast progression from product launch to institutional validation: a functioning Blockspace Futures Market, a Polychain-led raise, a governance token, and a Coinbase spot listing all landed within roughly three months (December 2025 to late February 2026). Few infrastructure tokens achieve top-tier exchange listing this quickly after TGE, which reflects genuine institutional and exchange-level confidence in the team and product category.

At the same time, the token's price trajectory has moved in the opposite direction of this institutional momentum since shortly after launch, and the Vitalik Buterin protocol-native gas futures proposal in December 2025 (right before ETHGas's own token launch) is a piece of context worth flagging clearly: it is simultaneously the strongest available third-party validation of ETHGas's core problem thesis, and a reminder that Ethereum's own core development community is actively exploring alternatives to commercial, out-of-protocol solutions like ETHGas.

11 INVESTMENT POTENTIAL & RISKS

+ Bull Case

- Founder has genuinely rare, directly relevant 20+ year TradFi derivatives/structuring background (Morgan Stanley, Barclays, ING Barings) matched precisely to the "blockspace futures market" thesis
- Real, large-scale institutional commitments: \$800M in liquidity commitments and a three-year, \$3B forward-market partnership with Ether.fi
- Credible, TradFi-adjacent investor syndicate including major market maker Susquehanna alongside Polychain-led venture backing
- Addresses a genuinely real, widely-recognized Ethereum limitation with concrete, already-live product primitives (inclusion preconfirmations, whole-block commitments)
- Unusually fast institutional validation: Coinbase spot and futures listings achieved within about six weeks of TGE
- Reported pre-TGE user base of 283,000+ suggests genuine early engagement rather than a purely speculative launch

– Bear Case

- Only ~17.5% of max supply circulates; the Investors (27%) and Team (22%) buckets — 49% of total supply — remain entirely locked as of this report
- Extremely low market-cap-to-FDV ratio (≈ 0.17) signals the market is pricing in substantial future dilution as large insider allocations vest
- Token has fallen roughly 91% from its January 2026 all-time high and trades not far above its all-time low, with recent coverage describing a "deep pullback"
- No specific third-party security audit for ETHGas's own infrastructure was identified in sources reviewed for this report
- Faces the deeply entrenched, free, open-source incumbent Flashbots/MEV-Boost, plus direct preconfirmation competitors (Primev, Espresso)
- Ethereum co-founder Vitalik Buterin's own December 2025 proposal for a trustless, protocol-native gas futures market poses a long-term structural risk to ETHGas's commercial, out-of-protocol positioning

RISK FACTOR	DETAILED EXPLANATION
Token Unlock / Dilution Risk	49% of total supply (Investors + Team) is entirely locked as of this report and will progressively vest, representing substantial future dilution pressure against a currently small circulating base
Audit / Security Risk	No specific third-party security audit for ETHGas's infrastructure was identified in sources reviewed, despite the protocol handling real-time financial settlement commitments
Protocol-Native Competition Risk	A trustless, on-chain gas futures market has been publicly proposed by Ethereum's own co-founder, which could reduce long-term demand for ETHGas's commercial offering if implemented at the protocol level
Incumbent Competition Risk	Flashbots/MEV-Boost is free, open-source, and already the dominant standard used by most Ethereum validators, raising the bar for ETHGas's commercial value proposition
Price / Valuation Risk	Token down ~91% from ATH with a very low market-cap-to-FDV ratio, indicating the market has already priced in meaningful skepticism or anticipated dilution
Team Depth / Transparency Risk	Public biographical and track-record information for technical leadership beyond the CEO is limited in sources reviewed

NBZ Research Verdict

ETHGas is led by a founder with an unusually well-matched background for its specific thesis, has secured genuinely significant institutional commitments (the \$3B Ether.fi partnership, \$800M in liquidity commitments) in a remarkably short window, and addresses a real, widely-acknowledged limitation in how Ethereum allocates blockspace. Its rapid progression to Coinbase spot listing within weeks of TGE reflects real institutional and exchange-level confidence. Against this, GWEI carries substantial near-term structural risk: nearly half of total supply remains entirely locked and has yet to hit the market, no specific third-party security audit was identified, and the token has already fallen roughly 91% from its all-time high just months after launch. The competitive landscape adds a further, unusual wrinkle: Ethereum's own co-founder has proposed a protocol-native alternative to exactly the problem ETHGas is commercially solving.

Conditions that would strengthen the bull case: a published third-party security audit, demonstrated resilience in price and usage as the large Investor/Team unlocks begin vesting, and continued institutional deal flow beyond the Ether.fi partnership. The most critical near-term risk is the collision between a very large pending token unlock and a market that has already shown limited appetite to absorb new GWEI supply. Positioning: GWEI suits investors specifically convinced by the blockspace-futures thesis and comfortable underwriting significant unlock-driven dilution risk in the coming vesting period — not investors seeking a token with most of its supply-related uncertainty already resolved.

Not financial advice.
