■ UNRESOLVED ITEMS TO WATCH

FIGHT trades roughly 89–90% below its January 22, 2026 all-time high of ~\$0.0298–\$0.0337, a decline that began almost immediately after its two oversubscribed token sales (see Section 08 and Section 10). Sources disagree on FIGHT's underlying blockchain — official/press materials describe it as Solana-based, while at least one exchange listing page shows it deployed on BNB Chain — an unresolved discrepancy worth verifying directly before transacting (see Section 01). A separate, pre-existing “UFC Fan Token” on the unrelated Chiliz/Socios platform has itself fallen roughly 62% and trades at a tiny ~\$289K market cap as of mid-2026, underscoring that UFC licensing alone has not historically guaranteed token demand (see Section 09).

Blockchain Layer	Reported as Solana-based by the project and most press coverage; at least one exchange (MEXC) lists FIGHT as a BNB Chain (BSC) token — an unresolved cross-source discrepancy
Protocol Type	Licensed Web3 fan-identity and reputation ecosystem for combat sports — on-chain identity (Fight.ID), non-transferable reputation points (FP), and the \$FIGHT utility/governance token
Founded / TGE	Fight Foundation formed as an independent, non-profit steward; two token sales closed October 27 and October 30, 2025; broader token trading began in early 2026
Total Raised	\$198.7M combined across two public token sales (\$15.7M on Oct 27, 2025, and \$183M on Oct 30, 2025), both dramatically oversubscribed against modest six-figure targets
Website	app.fight.id; whitepaper at read.fight.foundation

Research by NBZ / NASIR

01 PROJECT OVERVIEW

Field	Detail
Project Name	Fight.ID / Fight Foundation
Ticker	\$FIGHT
Blockchain Layer	Reported as Solana-based per official/press materials; at least one exchange listing (MEXC) shows FIGHT deployed on BNB Chain (BSC) — an unresolved discrepancy investors should independently verify before transacting
Protocol Type	Licensed Web3 combat-sports fan ecosystem: on-chain identity (Fight.ID), non-transferable reputation points ("FP"), and the \$FIGHT utility/governance/ownership token
Founded	Fight Foundation formed as an independent, non-profit steward of the ecosystem; built by Fightfi, a company connected to Concept Labs, which holds UFC-related IP and sponsorship licensing rights
HQ	Concept Labs is based in San Francisco, California; Fight Foundation's specific jurisdiction was not independently confirmed in the sources reviewed
TGE Date	Two public token sales closed October 27, 2025 (\$15.7M) and October 30, 2025 (\$183M); broader trading and exchange listings followed into early 2026
Contract Address	Not independently verified from the materials provided — unconfirmed, and complicated by the Solana-vs-BSC discrepancy noted above
Website	app.fight.id; whitepaper at read.fight.foundation
Total Raised	\$198.7M combined across both public sales, both dramatically oversubscribed against modest six-figure fundraising targets (\$750K and \$1.5M respectively)
Circulating Supply	2.05B FIGHT (20.5% of max supply) as of the in-app snapshot reviewed
Max Supply	10,000,000,000 FIGHT (fixed)
Current Focus	Converting UFC-branded fan engagement (predictions, fighter communities, merch, Prize\$Fight bonuses) into sustained on-chain activity following a steep post-launch price decline

Fight.ID is built around a genuinely rare asset in crypto: an actual, licensed partnership with a major global sports property. Concept Labs, the company behind Fight.ID, has held UFC digital-collectibles licensing rights since at least 2023 (originally for UFC Strike, a Dapper Labs-originated NFT collectibles line on Flow), and that relationship evolved into a broader, UFC-acknowledged multi-year partnership underpinning Fight.ID. The project's structure separates three layers: Fight.ID itself is a portable, on-chain fan identity; FP ("Fighting Points") is a non-transferable reputation score that tracks engagement and unlocks perks; and \$FIGHT is the transferable token layered on top, used for staking, governance, access, and payments across the ecosystem.

The problem Fight.ID says it solves is fan-engagement fragmentation: today, a UFC fan's loyalty, engagement history, and purchases are scattered across disconnected platforms (ticketing sites, merch stores, prediction apps, social media) with no unified, fan-owned record and no direct path from being a spectator to having actual stake in outcomes. Fight.ID's differentiation claim rests specifically on its UFC license — unlike generic sports-fan-token platforms that sign team-by-team or league-by-league deals, Fight.ID is positioned as the singular, UFC-endorsed identity layer for the sport's global fanbase, with a stated fighter-first design reinforced by an advisory Fight Athlete Council including UFC veterans Gilbert Burns and Alexandre Pantoja.

02 TEAM & FOUNDERS

Name	Role	Background
James Zhang	Founder & CEO	Founder of Concept Art House (2007–present), a 13+ year, 1,000+ game creative-services studio for major brands (Call of Duty Mobile, Fortnite); CEO of Concept Labs since 2023; Founding Partner at Blockchain Coinvestors; advisor/investor across Project Galaxy, Xterio, SHRAPNEL, and NEAR Protocol; based in San Francisco; holds an Illustration degree from Ringling College of Art and Design
Klark Xia	Co-Founder & CSO	Named with a public photo and LinkedIn profile; specific prior professional history not independently detailed in the sources reviewed
Dimitri Lubimenko	CFO	Named with a public photo and LinkedIn profile; specific prior professional history not independently detailed in the sources reviewed
Randy Song	Chief BD & Sales	Named with a public photo and LinkedIn profile; specific prior professional history not independently detailed in the sources reviewed
Najeeb Kudiya	Team member (role not fully visible)	Listed on the project's public team page; specific role and background not independently detailed in the sources reviewed

Fight.ID's leadership is a genuine standout for verifiability within this research series: founder James Zhang has a long, independently confirmed public track record spanning multiple sources (his own LinkedIn, TheOrg, MarketScreener, RocketReach, and direct UFC press releases dating back to 2023). His prior venture, Concept Art House, has a real, checkable 13-year operating history producing creative work for major entertainment franchises, and his direct, personal relationship with UFC — predating Fight.ID by several years through the UFC Strike collectibles partnership — is the most credible explanation for how a relatively young Web3 project secured an official UFC endorsement rather than merely claiming an informal affiliation.

The broader leadership team (Klark Xia, Dimitri Lubimenko, Randy Song, Najeeb Kudiya) is presented with real photos and named LinkedIn profiles, which is a meaningfully higher transparency bar than several other projects in this research series clear, even though detailed prior-role verification for each individual was not completed from the sources available. On balance, Fight.ID's team credibility rests on real, checkable foundations — particularly Zhang's UFC relationship — that are independent of the project's own marketing materials, a genuinely differentiated strength.

03 TECHNOLOGY & ARCHITECTURE

Component	Description
Fight.ID	A portable, on-chain digital identity for fans and fighters, serving as the permanent account/profile layer across the ecosystem
FP (Fighting Points)	Non-transferable reputation points earned through participation, content engagement, and challenge completion; tracks fan activity and unlocks tiered ecosystem utility
\$FIGHT Token	A transferable Solana-based (per official materials) token used for access, staking, governance voting, fees, and rewards
Partner Burn Mechanism	Ecosystem partners burn \$FIGHT to distribute FP to participants, creating a direct, ongoing demand mechanism tied to partner activation rather than only speculative holding
Prize\$Fight	A DAO-administered prize-pool mechanism linked to individual fighters' career journeys, funding fighter bonuses tied to fan engagement
FightGear	Limited-edition combat-sports merchandise gated by \$FIGHT holdings and FP tier
Prediction Markets	In-app prediction experiences for UFC fight outcomes, using \$FIGHT for staking and rewards
Security Audits	No independently disclosed third-party smart-contract audit of the \$FIGHT token or its staking/reward contracts was identified in the sources reviewed

In plain terms, Fight.ID is less a novel piece of blockchain technology and more a conventional Web3 identity-and-loyalty stack applied to a specific, licensed sports property. The technical building blocks — an on-chain profile, non-transferable reputation points, a transferable governance/utility token, and a burn-to-reward mechanism for partner activations — are all well-established patterns elsewhere in crypto (similar in spirit to gaming and creator-economy loyalty systems). Fight.ID's genuine innovation is not architectural; it is the specific, exclusive combination of that stack with an actual UFC license and an athlete advisory council, a distribution and credibility advantage that is extremely difficult for a competitor to replicate regardless of technical sophistication.

The unresolved blockchain-platform discrepancy (Section 01) is worth treating as a genuine due-diligence flag rather than a minor footnote: official Fight.ID/press materials (CoinDesk, Bitget, the project's own X account) consistently describe FIGHT as Solana-based, while at least one active exchange listing page (MEXC) displays FIGHT as a BNB Chain (BSC) token. This could reflect a genuine multi-chain deployment, a wrapped/bridged version of the token on a secondary chain, or simply an error in one source's metadata — but until clarified directly from the project, anyone interacting with FIGHT on any specific exchange or chain should independently confirm the correct network and contract address before transacting, given the token's relatively low liquidity and market cap. No named, independent audit of the \$FIGHT smart contracts was identified in the sources reviewed, a gap worth weighing alongside the platform-discrepancy issue.

04

USE CASES & REAL-WORLD APPLICATIONS

Use Case	Description	Status
UFC Fight Predictions	Fans predict UFC fight outcomes, staking/earning \$FIGHT and FP based on accuracy	Live
Fighter Communities & Staking	Fans stake \$FIGHT to join specific fighter communities, unlocking AMAs, watch-alongs, and exclusive content	Live
Prize\$Fight Bonuses	DAO-administered prize pools tied to individual fighters' journeys, funded through ecosystem activity	Live
FightGear Merchandise	Limited-edition combat-sports merchandise gated by \$FIGHT and FP tier	Live
Governance & Treasury Voting	\$FIGHT holders vote on DAO treasury allocation, staking parameters, and grants	Live
Partner Activation / Ecosystem Integrations	Third-party partners burn \$FIGHT to distribute FP and activate the Fight.ID community for their own campaigns	Live
Portable Fan Identity Beyond UFC	Stated ambition to extend Fight.ID as a broader combat-sports identity standard beyond the initial UFC partnership	Roadmap

Fight.ID's live use cases are squarely built around genuine UFC fan behaviors — predicting fight outcomes, following specific fighters, and buying merchandise are all activities UFC's large global fanbase already engages in through other channels, and Fight.ID's pitch is to give those existing behaviors an on-chain, ownership-bearing layer rather than invent new behavior from scratch. That is a lower-risk product bet than projects that need to create entirely new user habits, since it requires converting existing fandom rather than generating demand from nothing.

The Prize\$Fight mechanism is the most distinctive and fighter-aligned use case on this list: rather than purely extracting value from fans, it explicitly channels ecosystem activity back to individual fighters as career bonuses, a structure that plausibly strengthens the athlete-side buy-in evidenced by the Fight Athlete Council's involvement. As with several other projects in this research series, the gap between stated ambition and demonstrated, independently measured usage (active predicting users, actual merchandise sales volume, fighter bonus payouts to date) was not fully closed by the sources reviewed — these use cases appear to be genuinely live product features, but usage-depth data independent of the project's own reporting was limited.

05 COMMUNITY & ECOSYSTEM

Metric	Data
Social Channels	X (Twitter) — Fight.ID verified account reports approximately 3.9K followers as of the in-app snapshot; Telegram and other channels also referenced in official materials
UFC Endorsement	UFC's official X account publicly acknowledged the Fight.ID collaboration; the partnership was formally announced as an expanded, multi-year UFC relationship on September 16
Fight Athlete Council	Advisory council including UFC veterans Gilbert Burns and Alexandre Pantoja, providing a fighter-first governance input channel
Token Sale Demand	Both public token sales were dramatically oversubscribed — \$15.7M raised against a \$750K target, then \$183M against a \$1.5M target days later — real, verifiable evidence of strong initial market demand
On-Chain Participation (at sale time)	Blockchain data (Solscan) showed 3,776 deposits to the project's fundraising address as of the sale period, evidencing broad, distributed participant interest rather than concentration in a handful of large buyers
Exchange Listings	Coinbase, Binance, Bybit, MEXC, KuCoin, and several additional venues per the in-app markets data
Market Rank	#1067 (in-app Overview) / #985 (in-app Markets/Vesting pages) — minor internal inconsistency reflecting different snapshot times

Fight.ID's community and distribution signal is genuinely strong on the credential side: the UFC's own public acknowledgment of the partnership, a real advisory council with recognizable, active UFC fighters, and the sheer scale of oversubscription on both token sales are all independently verifiable facts rather than self-reported marketing claims. Raising \$183M against a \$1.5M target in a single sale is an extraordinary demand signal by any standard, and the broad participant count (3,776+ distinct deposits) suggests that demand was reasonably distributed rather than driven by a small number of large, insider-adjacent buyers.

The tension worth naming clearly is between that overwhelming token-sale demand and Fight.ID's comparatively modest organic social following (roughly 3.9K X followers) — a gap that suggests much of the sale participation was driven by crypto-native speculative interest in an oversubscribed, UFC-branded opportunity rather than by an already-large, engaged fan community converting into token holders. That distinction matters for assessing durability: a large, pre-existing fan community converting to token holders would suggest more durable, engagement-driven demand, whereas primarily speculation-driven sale demand is more consistent with the steep post-launch price decline documented in Section 08.

06 INVESTORS & PARTNERSHIPS

Funding / Token Sale Rounds

Round	Date	Amount	Valuation	Notes
Public Sale I	Oct 27, 2025	\$15.7M (vs. \$750K target)	Unconfirmed	Public participants; dramatically oversubscribed
Public Sale II	Oct 30, 2025	\$183.0M (vs. \$1.5M target)	Unconfirmed	Public participants; among the largest oversubscription ratios of any 2025–2026 token sale reviewed in this series

Strategic Relationships

Partner / Entity	Relationship
UFC (Ultimate Fighting Championship)	Official, publicly acknowledged multi-year licensing and sponsorship partnership, held via Concept Labs; UFC's own X account has confirmed the collaboration
Concept Labs	Core contributor and IP licensor; holds UFC digital-collectibles and sponsorship rights; led by founder James Zhang
Fight Athlete Council	Advisory body including UFC fighters Gilbert Burns and Alexandre Pantoja, providing athlete input into ecosystem design

Unlike most projects in this research series, Fight.ID's fundraising was not structured as a traditional multi-round venture capital process with a named investor tier list — no VC funds, exchange-affiliated investment arms, or angel investors were identified as participants in the two public sales. Instead, capital was raised directly from the public in two back-to-back token sales, both of which saw extraordinary oversubscription. This structure means FIGHT's early holder base is likely far more retail-distributed than the VC-heavy cap tables seen elsewhere in this series, a meaningfully different risk and governance profile: there is no institutional lead investor whose reputation or continued backing serves as an ongoing credibility signal, but there is also less concentrated insider control of early supply.

The UFC relationship itself functions as Fight.ID's real strategic partnership in place of a traditional investor roster, and it is a genuinely differentiated, hard-to-replicate asset — official sports-league partnerships of this scale are rare in crypto, and UFC's own public acknowledgment (rather than only the project's own claims) meaningfully de-risks the authenticity question that surrounds many self-described "official partner" crypto projects. The corresponding structural risk is licensing-relationship dependency: Fight.ID's core value proposition is contractually tied to Concept Labs' UFC license remaining in force, and any deterioration in that relationship would directly and severely impact the project's central differentiator.

07 TOKENOMICS

Parameter	Detail
Total Supply	10,000,000,000 FIGHT (fixed)
Max Supply	10,000,000,000 FIGHT
Circulating Supply	2.05B FIGHT (20.5%) as of the in-app snapshot reviewed
Token Utility	Access and governance: exclusive content, priority event access, platform perks, and DAO voting rights over treasury allocation, staking parameters, and grants
Demand Mechanism	Ecosystem partners burn \$FIGHT to distribute FP to participants, creating recurring token demand tied directly to partner activation campaigns rather than speculation alone

Category	%	Tokens	Vesting / Notes
Community	52.20%	5.220B	20.1% unlocked, 32.1% locked — by far the largest allocation, reflecting Fight.ID's fan-first distribution philosophy
Investors	17.50%	1.750B	Fully locked (0% unlocked) as of the in-app snapshot — corresponds to the two public token-sale participants
Core Team	15.00%	1.500B	Fully locked (0% unlocked) as of the in-app snapshot
Liquidity	6.50%	0.650B	5% unlocked, 1.5% locked — supports exchange and DEX trading liquidity
Community Treasury	4.78%	0.478B	Fully unlocked — DAO-controlled treasury for ongoing ecosystem funding
Advisors	4.00%	0.400B	Fully locked (0% unlocked) as of the in-app snapshot

FIGHT's allocation is heavily community-weighted (52.2%, the largest single category of any project reviewed in this series), consistent with the project's stated fan-ownership philosophy. Notably, both the Investor (17.5%) and Core Team (15%) allocations show 0% unlocked as of the in-app snapshot — meaning the extreme price decline documented in Section 08 occurred before either of those large tranches (32.5% of total supply combined) began releasing. As with Fluent (BLEND), covered elsewhere in this series, this is a genuinely double-edged fact: the current price weakness cannot be attributed to insider or investor selling, which suggests organic demand fatigue is the primary driver — but it also means FIGHT's largest scheduled future supply events have not yet occurred and remain a real, unpriced risk ahead.

The Community allocation's split (20.1% already unlocked against 32.1% still locked) means a meaningful further share of the largest token category is still to be released, primarily through ongoing engagement-based distribution (FP conversion, partner activation burns, staking rewards) rather than a single cliff event. This structure ties a large share of future supply growth to actual platform engagement rather than a fixed calendar date, which is a more usage-linked design than a simple linear vesting schedule — though it also means total future dilution is harder to forecast precisely, since it depends on how much fan engagement activity actually occurs rather than a known, fixed unlock timeline.

08 MARKET OVERVIEW

Metric	Data
Price (24h range)	\$0.003235 – \$0.003526 (in-app)
Market Cap	\$6.96M (in-app) / \$17.07M (CryptoRank, different date) — notable variance across sources and snapshot dates given FIGHT's continuing decline
Fully Diluted Valuation	\$33.95M (in-app) / \$83.29M (CryptoRank)
24h Volume	\$1.39M (in-app); ranged as high as \$4.53M (CryptoRank) and, at the height of post-TGE speculative activity in early 2026, an extraordinary \$200–230M per one contemporaneous estimate
All-Time High	\$0.0337 (in-app) / \$0.0298 (CryptoRank, ATH market cap \$61.01M), reached January 22, 2026 — within roughly three months of the token sales closing
All-Time Low	\$0.002301 (in-app) / \$0.003663 (a different tracker, dated March 14, 2026) — minor cross-source disagreement on the exact low
Market Rank	#1067 (in-app Overview) / #985 (in-app Vesting/Markets pages) / #1056 (a separate tracker)
Notable Listings	Coinbase, Binance, Bybit, MEXC, KuCoin, and additional venues per the in-app markets data

FIGHT's price trajectory is one of the more severe among newer tokens covered in this research series, declining approximately 89–90% from its January 22, 2026 all-time high to the data-as-of price range. The timing is notable: the all-time high came nearly three months after the record-breaking \$183M token sale closed, suggesting the peak coincided with broader trading and exchange-listing activity rather than the sale itself, and the subsequent decline has been sustained rather than a brief post-listing dip. One industry headline from mid-2026 explicitly frames the situation as a test case for the broader sports-fan-token category: “UFC Crypto Fan Token Bleeds 62%” — though that specific figure and story actually refers to a separate, pre-existing UFC Fan Token on the unrelated Chiliz/Socios platform (tiny market cap, ~\$289K), not Fight.ID's \$FIGHT; the two should not be conflated, though both illustrate the same underlying pattern of UFC-branded token demand fading well after initial launch enthusiasm.

The extraordinary volume figures cited around FIGHT's early 2026 trading (as high as \$200–230M in 24-hour volume against a market cap in the tens of millions) point to intense, leverage-and-speculation-driven activity immediately following the token sales and FP-to-FIGHT conversion events — a pattern of trading volume dramatically exceeding market cap that several other newer tokens in this series (Fluent, APRO) have also exhibited around their own listing events. Investors should treat FIGHT's current, much lower price and volume levels as reflecting a market that has substantially cooled from that initial speculative peak, with the token's medium-term trajectory now depending far more on demonstrated platform engagement than on residual launch momentum.

09

COMPETITORS & MARKET POSITION

Project	Type / Focus	Scale	vs. Fight.ID
Chiliz (CHZ) / Socios.com	Sports-and-entertainment L1 powering 170+ team/league Fan Tokens (Barcelona, Juventus, PSG, national federations)	Established category leader; actively riding 2026 World Cup attention and a March 2026 US SEC/CFTC regulatory green light	Far broader, more diversified portfolio (170+ organizations vs. Fight.ID's single UFC focus) and a longer operating history, but no single Chiliz Fan Token carries UFC-scale global combat-sports exclusivity
"UFC Fan Token" (Chiliz/Socios)	A pre-existing, separate UFC-branded fan token on the Chiliz platform, unrelated to Fight.ID	Tiny — ~\$289K market cap, ~2.42M circulating tokens as of mid-2026, down ~62% from its own highs	A direct historical precedent and cautionary case within the same UFC brand: an earlier UFC-affiliated token that failed to sustain demand, illustrating that the UFC license alone does not guarantee lasting token value regardless of which platform hosts it
Fan Controlled Sports / Fanverse and similar niche fan-ownership platforms	Smaller, sport-specific fan-engagement and ownership platforms	Early-stage, limited scale	Generally lack Fight.ID's tier-one league licensing; compete more on novel ownership mechanics than brand exclusivity
Traditional (non-crypto) fan-engagement apps (official league apps, fantasy platforms)	Centralized, non-tokenized fan engagement and prediction products	Massive existing user bases (official UFC app, DraftKings, etc.)	Fight.ID's core competitive challenge is arguably less other crypto projects and more these entrenched, frictionless, non-crypto incumbents that already capture the bulk of UFC fan engagement without requiring a wallet or token

Fight.ID's most direct positioning advantage within the crypto-native sports-fan-token category is genuine exclusivity: while Chiliz/Socios has built a much larger, more diversified footprint across 170+ sports organizations, no single Chiliz Fan Token can claim UFC's specific, singular global combat-sports dominance the way Fight.ID can. That said, the existence of a separate, struggling "UFC Fan Token" already trading on Chiliz is an important, sobering data point: it demonstrates that a UFC association by itself, even on an established fan-token platform, has not historically been sufficient to sustain meaningful token demand once initial launch interest fades — a precedent Fight.ID's own post-January-2026 decline appears to be echoing, even though the two tokens are unrelated and Fight.ID's partnership is understood to be more comprehensive.

The more fundamental competitive question, as with several fan-engagement and gaming tokens covered elsewhere in this series, is whether crypto-native fan tokens can compete with frictionless, non-crypto incumbents (official league apps, fantasy sports platforms, standard e-commerce merch stores) that already capture the overwhelming majority of fan spending and engagement without requiring a wallet, a token purchase, or any blockchain literacy at all. Fight.ID's UFC partnership and Prize\$Fight fighter-alignment mechanism are genuine differentiators versus other crypto fan-token projects, but they do not by themselves solve the larger, industry-wide challenge of getting mainstream sports fans to adopt token-gated experiences over simpler existing alternatives.

10

RECENT NEWS & UPDATES

Date	Event
Jul 2023	UFC and Concept Labs announce a multi-year partnership to publish UFC Strike: Fight Camp, building on Concept Labs' existing UFC Strike digital-collectibles license (originally from Dapper Labs)
Sep 16, 2025	Fightfi (the company behind Fight.ID) announces an expanded UFC partnership, laying the groundwork for the Fight ecosystem and \$FIGHT token
Oct 27, 2025	First public \$FIGHT token sale closes, raising \$15.7M against a \$750K target
Oct 30, 2025	Second public \$FIGHT token sale closes, raising \$183M against a \$1.5M target — one of the largest oversubscription events of any token sale covered in this research series; UFC's official X account publicly acknowledges the Fight.ID collaboration around this period
Late 2025	Fight Athlete Council formed, including UFC veterans Gilbert Burns and Alexandre Pantoja, to provide fighter-first input into ecosystem design
Jan 2026	Broader \$FIGHT trading and exchange listings ramp up; WuBlockchain publishes an in-depth founder interview with James Zhang detailing the project's origin and UFC relationship
Jan 22, 2026	FIGHT reaches its all-time high (~\$0.030–\$0.034 depending on tracker), with ATH market cap cited around \$61M
Jan–Mar 2026	FIGHT price declines sharply from its all-time high; one tracker records a local low as early as March 14, 2026
Jun 2026	Industry commentary (“UFC Crypto Fan Token Bleeds 62%”) draws broader attention to fading momentum across UFC-affiliated fan tokens, though the specific figures cited pertain to a separate, unrelated Chiliz-platform UFC Fan Token rather than \$FIGHT directly
Aug 2026 (data-as-of)	FIGHT trades in the \$0.0032–\$0.0035 range, roughly 89–90% below its January 2026 all-time high, per the most recent snapshots reviewed

Fight.ID's timeline shows a project whose real-world credibility (the UFC relationship, the athlete council, founder James Zhang's multi-year track record) has remained consistent and undisputed throughout, even as the token's market performance has followed a familiar, steep post-launch decline pattern. Unlike several projects in this research series where the underlying partnership or product claims themselves came under question, no sources reviewed suggest any deterioration in the UFC relationship, contested licensing status, or founder controversy — the risk here is squarely about token-market dynamics (oversubscription-driven speculative demand fading) rather than about the legitimacy of the underlying partnership.

No security incidents, exploits, or contested governance events specific to Fight.ID were identified in the sources reviewed. The most important open item going forward is whether Fight.ID's genuine fan-engagement mechanics (predictions, fighter communities, Prize\$Fight bonuses) can generate the kind of sustained, usage-driven demand for \$FIGHT that would differentiate its trajectory from the cautionary Chiliz-platform “UFC Fan Token” precedent — a question the roughly seven months of data available as of this report's writing has not yet answered definitively in either direction.

11

INVESTMENT POTENTIAL & RISKS

▲ BULL CASE

- A genuine, officially acknowledged UFC partnership — an exceptionally rare, hard-to-replicate credibility asset among crypto sports-fan projects, backed by UFC's own public confirmation rather than only the project's claims.
- A verifiable, credentialed founder (James Zhang) with an independently confirmed multi-year track record in gaming/entertainment and a direct, years-long relationship with UFC predating the token itself.
- Extraordinary, independently verifiable initial demand: \$198.7M raised across two dramatically oversubscribed public sales, with broadly distributed on-chain participation (3,776+ deposits) rather than concentrated insider buying.
- A fighter-aligned incentive design (Prize\$Fight, Fight Athlete Council with active UFC veterans) that plausibly strengthens athlete-side buy-in beyond a purely fan-facing product.
- Investor and Team allocations remain fully locked as of this snapshot, meaning the steep price decline to date reflects organic demand fatigue rather than insider selling — the largest scheduled supply events have not yet occurred.

▼ BEAR CASE

- FIGHT has declined approximately 89–90% from its January 2026 all-time high, one of the steepest, most sustained drawdowns among newer tokens covered in this research series.
- An unresolved cross-source discrepancy on FIGHT's underlying blockchain (Solana per official materials vs. BNB Chain per at least one exchange listing) is a genuine due-diligence red flag requiring direct verification before transacting.
- No independently disclosed third-party security audit of the \$FIGHT token or its staking/reward contracts was identified in the sources reviewed.
- A directly comparable precedent — a separate, pre-existing UFC Fan Token on the Chiliz platform — has itself collapsed to a tiny ~\$289K market cap, demonstrating that UFC branding alone has not historically sustained token demand once launch enthusiasm fades.
- Modest organic social following (~3.9K X followers) relative to the scale of token-sale demand suggests much of the initial capital raised was speculative/crypto-native rather than driven by an already-large, converting fan base.
- Structural dependency on a single licensing relationship (UFC, via Concept Labs) concentrates the project's entire differentiation in one contractual relationship outside the token holders' control.

Risk Factor Detail

Risk	Detailed Explanation
Steep, Sustained Post-Launch Decline	A ~89–90% decline from all-time high over roughly seven months, without an identified sustained reversal, indicates persistently weak token-market confidence independent of the underlying partnership's legitimacy.
Blockchain/Platform Discrepancy	Conflicting data on whether FIGHT is a Solana or BNB Chain token is an unresolved, verifiable-before-transacting concern that most other projects in this series do not exhibit.
Unaudited Smart Contracts	No named third-party audit of \$FIGHT's token or reward-distribution contracts was identified, a meaningful gap given the scale of capital raised (\$198.7M) relative to typical due-diligence standards for that size of raise.
UFC Fan-Token Category Precedent	A separate but directly relevant precedent (the Chiliz-platform UFC Fan Token's collapse to ~\$289K market cap) demonstrates that UFC association alone has not reliably sustained crypto token value in this specific category before.

Risk	Detailed Explanation
Speculative-Demand Concentration	The gap between token-sale oversubscription and organic social following suggests initial capital was substantially speculation-driven, a demand base more prone to rapid exit than an engaged, converting fan community.
Single-Partnership Dependency	Fight.ID's core differentiation rests entirely on the UFC/Concept Labs licensing relationship remaining intact and exclusive; any deterioration in that relationship would directly undermine the project's primary value proposition.

NBZ RESEARCH VERDICT

Fight.ID holds one of the most genuinely differentiated, hard-to-replicate assets in this entire research series: an actual, officially acknowledged UFC partnership, led by a founder with a real, independently verifiable multi-year track record and a direct, pre-existing relationship with the organization. That combination is worth serious attention — it is a fundamentally different credibility tier than most crypto-native sports or fan-engagement projects, which typically operate with informal, unverified, or aspirational brand associations rather than a confirmed license. What tempers that strength considerably is the token's market performance to date: an ~89–90% decline from all-time high within seven months, a directly relevant cautionary precedent in the Chiliz-platform UFC Fan Token's own collapse, an unresolved blockchain-platform discrepancy that demands direct verification, and no disclosed audit of contracts that processed nearly \$200M in raised capital. What would make this materially more convincingly bullish: independently measured, sustained platform engagement (active predictors, fighter-community participation, Prize\$Fight payouts) that demonstrates genuine fan conversion beyond the initial speculative sale demand; a published third-party audit of the \$FIGHT contracts; and resolution of the Solana/BNB Chain discrepancy. The most critical risks are the severe, sustained price decline, the unresolved platform discrepancy, and the cautionary UFC-fan-token-category precedent. Positioning: a partnership-credibility-driven, speculative allocation appropriate for a thesis specifically about Fight.ID converting genuine UFC fan engagement into durable token demand — not a position sized around the strength of the underlying license alone, which the evidence suggests has not yet been sufficient, on its own, to sustain the token's early valuation.

Sources Consulted: Fight Foundation's official whitepaper (read.fight.foundation) and app (app.fight.id); in-app market data screenshots provided by the user (Aug 2026 snapshot); CryptoRank.io, CoinMarketCap (including CMC AI), and MEXC for market and platform data; CoinDesk and Bitget News for token-sale coverage; Bittrue Blog, Whales Market Blog, and CoinEx Academy for ecosystem and tokenomics detail; WuBlockchain (Medium) for the James Zhang founder interview; UFC.com, PlayToEarn, TheOrg, CypherHunter, MarketScreener, RocketReach, and LinkedIn for founder background verification; Bitcoin Foundation News for UFC-fan-token category context; Chiliz's official website, X account, CoinMarketCap, CoinPedia, and KuCoin Learn for competitive-landscape context (Chiliz/Socios, the separate Chiliz-platform UFC Fan Token).

NOT FINANCIAL ADVICE.
