

GOPLUS SECURITY

\$GPS

Web3's Most Widely Integrated Security Layer, Expanding to Protect AI Agents

\$0.009875–\$0.01708 24H PRICE RANGE	\$92.87M MARKET CAP	\$164.07M FDV	5.66B CIRC. SUPPLY	#169 MARKET RANK
--	-------------------------------	-------------------------	------------------------------	----------------------------

■ UNRESOLVED ITEMS TO WATCH

Within days of its March 4, 2025 Binance listing, GPS was placed on Binance's Monitoring List after a market maker sold 70 million GPS tokens in under 24 hours, triggering a sharp price drop flagged as unusual market-making activity (see Section 10). The 24-hour price range and volume shown on this cover reflect a snapshot with an unusually wide intraday swing (+56–59% shown across multiple exchange listings, see Section 08) — treat single-source price figures as approximate. No independent, publicly disclosed audit of the GPS token contract or staking mechanism itself (as distinct from GoPlus's own security-scanning products) was identified in the sources reviewed (see Section 03).

Blockchain Layer	Deployed on Base (ERC-20); GoPlus's security infrastructure and API services operate chain-agnostically across 30–40+ networks
Protocol Type	Decentralized Web3 and AI-agent security layer — real-time risk detection, transaction simulation, and runtime protection
Founded / TGE	Company operating since 2020–2021 (Singapore); GPS token generation event January 16, 2025
Total Raised	\$10.00M in a private funding round closed June 5, 2024, led by Binance Labs, plus earlier undisclosed angel/seed rounds dating to 2021–2022
Website	gopluslabs.io/en

Research by NBZ / NASIR
Data as of August 17, 2026

01

PROJECT OVERVIEW

Field	Detail
Project Name	GoPlus Security
Ticker	\$GPS
Blockchain Layer	GPS token deployed on Base (ERC-20); GoPlus's underlying security infrastructure and APIs operate chain-agnostically across 30–40+ blockchain networks
Protocol Type	Decentralized Web3 and AI-agent security layer — real-time risk detection, transaction simulation, runtime protection, and token/contract auditing
Founded	Company building since 2020–2021; incorporated and headquartered in Singapore
HQ	Singapore
TGE Date	January 16, 2025 (initial exchange listings on KuCoin, Bitget, MEXC, Bybit, Gate, CoinW); Binance listing followed March 4, 2025
Contract Address	0x0c1dc73159e30c4b06170f2593d3118968a0dca5 (Base; per public token tracker data)
Website	gopluslabs.io/en
Total Raised	\$10.00M private round closed June 5, 2024, led by Binance Labs; earlier undisclosed rounds in 2021–2022
Circulating Supply	5.66B GPS (~56.6% of max supply) as of the in-app snapshot reviewed
Max Supply	10,000,000,000 GPS (fixed)
Current Focus	Extending its established Web3 security business (token/contract risk scanning, wallet protection) into AI-agent runtime security via its new AgentGuard product

GoPlus Security is a Web3 security infrastructure provider whose products are already embedded, often invisibly, in tools millions of crypto users interact with daily — its Token Security API and malicious-address detection are integrated into major wallets, exchanges, and browser extensions including MetaMask and Trust Wallet. Rather than a single consumer-facing app, GoPlus operates primarily as B2B security infrastructure: developers and platforms plug into GoPlus's APIs to automatically warn their own users about honeypot tokens, malicious contracts, phishing sites, and risky wallet approvals before a transaction is signed.

The GPS token, launched in January 2025, is the newest layer on top of an already-operating security business that has run since roughly 2020–2021: it converts what was previously a centralized service into a token-incentivized network, where staking, governance, and payment for premium security services all run through GPS. As of its 2026 whitepaper, GoPlus has also explicitly repositioned its mission around a second, larger problem: securing autonomous AI agents that browse the web, call tools, manage credentials, and execute transactions on a user's behalf. The differentiation claim here is continuity — GoPlus argues its existing, battle-tested Web3 risk-detection infrastructure gives it a head start applying the same “detect, decide, enforce, verify, audit” model to AI agent runtime security, a category with few established incumbents yet.

02 TEAM & FOUNDERS

Name	Role	Background
Yufeng Xu	Founder	Listed as GoPlus Security's founder in third-party company-data profiles (CB Insights); further public professional background not independently confirmed in the sources reviewed
Mike	Founder (per in-app team listing)	Public profile shown without a photo or verifiable professional background in the sources reviewed
Eskil Xu	Co-Founder	Public profile shown without a photo; LinkedIn listed but professional background not independently confirmed in the sources reviewed
Allen Zhang	Co-Founder & CTO	Public profile shown without a photo; LinkedIn listed but professional background not independently confirmed in the sources reviewed

GoPlus's team disclosure sits in an unusual middle ground: unlike a fully pseudonymous project, the company has a six-year operating history (2020–present), a Singapore incorporation, and named founders across different public sources (Yufeng Xu per CB Insights; Mike, Eskil Xu, and Allen Zhang per the project's own in-app team page) — but none of these individuals have easily verifiable, detailed professional histories in the sources reviewed, and the in-app listings show generic placeholder avatars rather than personal photos. This is a lesser degree of anonymity than a fully pseudonymous crypto team, but a meaningfully lower transparency bar than companies of comparable maturity typically clear.

What substitutes for individual-level team credibility here is operating track record: GoPlus has been running live security infrastructure since roughly 2020–2021, well before the GPS token existed, and its APIs are independently verifiable as integrated into major, named third-party products (MetaMask, Trust Wallet, and reportedly Binance). That kind of multi-year, product-verified distribution is a different and arguably stronger signal than founder biographies alone, though it does not fully substitute for transparency about who is accountable for decisions at the company and DAO/foundation level as the project's ambitions expand into the higher-stakes AI-agent security category.

03

TECHNOLOGY & ARCHITECTURE

Component	Description
Core Model	"Detect → Decide → Enforce → Verify → Audit" security-before-execution pipeline applied to both Web3 transactions and AI agent actions
GoPlus Intelligence	Risk analysis engine: real-time security intelligence, transaction simulation, malicious-address detection, token risk analysis, phishing-site detection, approval/signature analysis
AgentGuard	AI agent runtime security product; local-first runtime protection, policy enforcement, approval workflows, audit timelines, and supply-chain scanning for agent tool calls and transactions
DeepScan	AI-powered token security audit combining static analysis, LLM-based semantic audit, financial-semantic modeling, and pattern recognition to flag rug-pull/honeypot/access-control risks
SafeToken Protocol	Standardized secure token-issuance templates and liquidity protection for new token launches
GoPlus Web3 Security	Full transaction-lifecycle protection via API, browser extension, GoPlus App, transaction simulation, Security RPC, and on-chain firewall infrastructure
GoPlus Security Network	The decentralized layer: data contributors, node operators, and governance participants collaborate to provide and validate security services, coordinated via GPS staking
Security Audits (of GPS itself)	No independently disclosed third-party audit specifically of the GPS token contract, staking mechanism, or Security Network consensus logic was identified in the sources reviewed

In plain terms: GoPlus sits between a risky action and its execution, whether that action is a human clicking "confirm" on a wallet transaction or an AI agent about to run a shell command or sign a transaction on a user's behalf. Before the action goes through, GoPlus's systems check it against a large, continuously updated database of known scam patterns, malicious contract behavior, and suspicious address activity, then either allow, block, warn, or escalate it. This is architecturally different from an auditor that reviews code once before launch (like a traditional smart-contract audit firm) — GoPlus's value proposition is continuous, real-time protection at the moment of every transaction, not a one-time certification.

The technically newest and most strategically important piece is AgentGuard, launched to extend this same model to AI agents specifically — addressing risks like prompt injection, malicious tool calls, credential exfiltration, and agent-initiated transactions, a genuinely emerging attack surface with very few established, named competitors as of the data-as-of date (see Section 09). The clearest gap in GoPlus's public technical disclosure is the absence of a named, independent audit specifically covering the GPS token's own smart contracts and staking/consensus mechanism — a real, if somewhat ironic, gap for a company whose core business is auditing other projects' contracts for exactly this kind of risk. GoPlus's underlying detection APIs, by contrast, have an extensive multi-year public operating record that offers some indirect evidence of reliability, even without a formal third-party audit report specifically covering the token layer.

04

USE CASES & REAL-WORLD APPLICATIONS

Use Case	Description	Status
Token/Contract Risk Scanning	Automated detection of honeypots, malicious contracts, rug-pull risk, and access-control issues via Token Security API and DeepScan	Live
Malicious Address Detection	Real-time database identifying phishing sites, scam addresses, and drainer wallets, integrated into major wallets and exchanges	Live
Wallet Approval Security (SecWareX)	Reviews and flags risky smart-contract approvals users have granted, letting them revoke high-risk permissions	Live
Transaction Simulation / Security RPC	Simulates transactions before signing and routes execution through security-aware RPC infrastructure to block malicious transactions pre-execution	Live
SafeToken Protocol	Standardized secure contract templates and liquidity protections for new token launches	Live
AI Agent Runtime Protection (AgentGuard)	Policy enforcement, approval workflows, and supply-chain scanning for AI agents' tool calls, file access, and transactions	Live (newly launched)
Decentralized Security Network	Open, staked network of data contributors and validators providing and verifying security signals, coordinated via GPS	Live / Scaling

GoPlus's use cases split into a mature, well-evidenced Web3 security business and a newer, higher-upside AI-agent security push. On the Web3 side, the evidence of real, independent usage is unusually strong for a project this size: per CoinDesk protocol research, GoPlus's Token Security API averaged roughly 717 million monthly calls in 2025, peaking near 1 billion calls in a single month, with an additional ~350 million monthly blockchain-level requests including transaction simulations. Named integrations with Binance, MetaMask, and Trust Wallet are independently checkable rather than self-reported claims requiring trust in GoPlus alone.

The AI-agent security push (AgentGuard) is the newer, less-proven half of the business. It targets a genuinely emerging and currently underserved problem — as AI agents gain the ability to execute shell commands, handle credentials, and sign transactions autonomously, few dedicated security products exist yet to protect that specific runtime. That makes AgentGuard a credible first-mover opportunity, but as of the data-as-of date it does not yet have the multi-year, independently-verified usage track record that GoPlus's core Web3 products have built. Whether AgentGuard achieves comparable distribution to GoPlus's existing wallet/exchange integrations is the single biggest open question determining whether GPS's AI narrative converts into the same kind of durable, high-volume usage its Web3 business already demonstrates.

05 COMMUNITY & ECOSYSTEM

Metric	Data
Social Channels	X (Twitter), Telegram, Discord, LinkedIn, GitHub, and an official blog
API Usage Scale	~717M average monthly Token Security API calls in 2025 (peak ~1B in February 2025); ~350M additional monthly blockchain-level requests
Chain Coverage	30–40+ blockchain networks supported by GoPlus's security infrastructure
2025 Token Trading Volume	Over \$5B in spot volume and \$10B in derivatives volume in 2025, per CoinDesk protocol research; monthly spot volume peaked above \$1.1B in March 2025
Named Integrations	Binance, MetaMask, Trust Wallet, and a broad set of wallets, dApps, exchanges, RPC providers, and launchpads
SecWareX Adoption	Reported to have protected over 100,000 users within its first week post-launch
Market Rank	#169 (in-app Overview) / #224 (in-app Team page) — internal inconsistency likely reflecting different snapshot dates

GoPlus's ecosystem strength is a genuine standout among the projects covered in this research series: its usage metrics are independently corroborated by third-party research (CoinDesk) rather than resting solely on the company's own communications, and its named integration partners (Binance, MetaMask, Trust Wallet) are among the most consequential distribution points in all of crypto — being embedded in MetaMask and Trust Wallet alone means GoPlus's detection infrastructure likely touches a meaningful share of all Web3 wallet users, whether or not those users have ever heard the GoPlus name.

The trading-volume figures (\$5B+ spot, \$10B+ derivatives in 2025) indicate genuine market interest in the token beyond just the underlying product usage, though as with any token these figures reflect speculative trading activity as much as fundamental demand and should not be conflated with product usage metrics. The one meaningful data-quality flag is the internally inconsistent market rank shown across different pages of the same data source (#169 vs. #224), a reminder to treat any single snapshot figure as approximate.

06 INVESTORS & PARTNERSHIPS

Funding Rounds

Round	Date	Amount	Valuation	Lead
Private Round	Jun 5, 2024	\$10.00M	Unconfirmed	Binance Labs (now YZi Labs) — Lead
Private Round II	2024	Undisclosed	Unconfirmed	Binance Labs — Lead
Private Funding Round	Dec 8, 2022	Undisclosed	Unconfirmed	Multiple participants
Angel Round	Q2 2022	Undisclosed	Unconfirmed	Early angel backers
Earliest Round	Q3 2021	Undisclosed	Unconfirmed	Founding-stage backers

Investor Roster

Tier	Investor	Type
Tier 1	YZi Labs / Binance Labs (Lead)	Incubator
Tier 1	HashKey Capital	Venture
Tier 2	GSR	Venture
Tier 2	OKX Ventures	Venture
Tier 2	Fenbushi Capital	Venture
Tier 2	KuCoin Ventures	Venture
Tier 3	SevenX Ventures (Lead)	Venture
Tier 3	Animoca Brands	Venture
Tier 3	HTX Ventures	Exchange
Tier 3	Crypto.com Capital	Exchange
Tier 3	Youbi Capital	Venture
Tier 3	LucidBlue Ventures	Venture
Tier 3	Incuba Alpha	Venture
Tier 3	Avatar	Venture
Tier 4	Web3Port Foundation	Venture
Tier 4	Delta Blockchain Fund	Venture

GoPlus's investor roster is exceptionally broad — among the largest investor counts of any project covered in this research series — spanning nearly every major exchange-affiliated venture arm (Binance Labs/YZi Labs, OKX Ventures, HTX Ventures, Crypto.com Capital, KuCoin Ventures) alongside established crypto-native funds (HashKey Capital, Fenbushi Capital, Animoca Brands, GSR). That breadth of exchange-affiliated backing is a particularly strong signal for a security infrastructure company specifically, since exchanges are exactly the kind of counterparty that benefits most directly from integrating GoPlus's

risk-detection APIs — investor and distribution incentives are unusually well aligned here.

Binance Labs' (now YZi Labs) role as lead investor across at least two rounds, combined with GoPlus's rapid Binance HODLer Airdrop listing in March 2025, indicates a particularly deep relationship with the world's largest exchange — a relationship that plausibly explains GoPlus's broad integration reach but also means a meaningful share of the project's institutional support is concentrated around a single ecosystem. As with several other reports in this series, the precise dollar amounts for most rounds beyond the disclosed \$10M June 2024 raise were not independently confirmed, and total lifetime funding across all rounds (2021–2024) is not clearly stated in any single source reviewed.

07 TOKENOMICS

Parameter	Detail
Total Supply	10,000,000,000 GPS (fixed)
Max Supply	10,000,000,000 GPS
Circulating Supply	5.66B GPS (~56.6%) as of the in-app snapshot reviewed
Token Standard	ERC-20, deployed on Base
TGE Date	January 16, 2025
Circulating Supply at Binance Listing	1.81B GPS (~18.1% of total) as of the March 4, 2025 Binance listing
Team Vesting	6-month cliff after TGE, then 24 months of monthly linear vesting — full team distribution takes 7 years from TGE
Investor Vesting	Cliff-and-vesting schedules across different rounds, aligned to long-term ecosystem incentives (specific per-round terms not fully itemized in sources reviewed)
Airdrop / Marketing Reserve	300M GPS (3%) allocated to Binance HODLer Airdrops; 400M GPS (4%) reserved for marketing campaigns starting 6 months post-listing

Category	%	Tokens	Vesting / Notes
Community	24.67%	2.467B	Largest single allocation; broad community and ecosystem distribution
Team	20.00%	2.000B	6-month cliff, then 24-month linear vesting; full distribution takes 7 years
Investor	19.33%	1.933B	Cliff-and-vesting schedules by round, aligned to long-term incentives
Airdrop	10.00%	1.000B	Includes the 300M GPS Binance HODLer Airdrop tranche
Ecosystem	10.00%	1.000B	Ecosystem grants and development incentives
Liquidity	7.00%	0.700B	Exchange and DEX liquidity provisioning
Marketing	6.00%	0.600B	Includes the 400M GPS reserve released starting 6 months post-listing
Advisor	3.00%	0.300B	Advisor allocation, smallest tranche

GPS's distribution is notably community-weighted at the top line (24.67% to Community, the single largest category), but the combined Team + Investor allocation (39.33%) is proportionally larger than several other projects covered in this research series, and circulating supply started very low — only about 18.1% of total supply was liquid at the March 2025 Binance listing. The team's 7-year full-vesting timeline (a 6-month cliff followed by 24 months of vesting, explicitly marketed by GoPlus as demonstrating long-term commitment) is one of the longer team lockup structures reviewed in this series, a genuine alignment positive if honored as structured.

The most important tokenomics-adjacent fact is not a scheduled unlock but a market-structure event: within 48 hours of the Binance listing, a market maker sold 70 million GPS tokens, triggering a sharp price decline and prompting Binance to add GPS to its Monitoring List for unusual market-making activity (see Section 10). That event is a more immediate red flag for prospective holders than the vesting schedule itself — it indicates that even with a relatively low initial float, GPS's early liquidity was thin enough for a single market participant's activity to move price sharply and draw exchange-level scrutiny.

08 MARKET OVERVIEW

Metric	Data
Price (24h range)	\$0.009875 – \$0.01708 (in-app); note this is an unusually wide 24h range, and several exchange listings in the same snapshot showed +55–59% single-day moves
Market Cap	\$92.87M (in-app, circulating) / \$107.88M (in-app, unlocked)
Fully Diluted Valuation	\$164.07M
24h Volume	\$132.04M (in-app, aggregated); individual exchange volumes ranged from Binance's \$34.27M down to smaller venues near \$37K
All-Time High	\$0.2201 (in-app); reached amid the intense volatility surrounding the March 2025 Binance listing
All-Time Low	\$0.004404
Market Rank	#169 (in-app Overview) / #224 (in-app Team page) — internally inconsistent across the same data pull
Notable Listings	Binance, Binance TR, OKX, Bithumb, KuCoin, Bybit, Gate, MEXC, Bitget, BingX, LBank, CoinW, DigiFinex, Bitunix, WhiteBIT, Phemex, Hotcoin, CoinEx, PancakeSwap

GPS's price history has been defined by its dramatic, controversy-adjacent Binance debut: the token reportedly surged as much as 2,840% on some exchanges in the run-up to the March 4, 2025 Binance listing, reached its all-time high shortly after, and then fell sharply enough within 48 hours to trigger Binance's Monitoring List designation over suspected market manipulation. From that high (~\$0.22), GPS has since declined substantially toward its current data-as-of range (~\$0.0099–\$0.017), a decline broadly consistent with the pattern seen across other small- and mid-cap tokens in this series that launched into intense initial speculative demand.

The 24-hour price data captured in this snapshot shows an unusually wide range accompanied by large, near-uniform positive percentage moves (+55–59%) across nearly every listed exchange — a pattern more consistent with a broad market-wide rally or a data-timing artifact (e.g., the snapshot capturing a sharp intraday recovery) than typical daily volatility. Given GPS's documented history of exchange-flagged unusual market-making activity, any single-source price or percentage-change figure for GPS should be treated with extra caution and cross-checked against multiple exchanges and a longer time window before being used for decision-making.

09

COMPETITORS & MARKET POSITION

Project	Type / Focus	Scale	vs. GoPlus
Token Sniffer (Solidus Labs)	Free web-based scam/honeypot detection, contract similarity database	Private (institutional backing)	Strongest brand recognition (“the tool traders actually name”) and swap-simulation honeypot testing; GoPlus wins on broader chain coverage
De.Fi Shield / De.Fi Scanner	Wallet-approval and contract-permission scanning, governance analysis	Private	Deeper governance/permission-flag analysis than GoPlus's SecWareX per third-party comparisons; a frequently cited direct alternative
CertiK	Formal-verification smart contract audits, AI-powered scanning, Skynet monitoring	Largest blockchain security auditor by market position	Operates more like a one-time/point-in-time audit firm at scale versus GoPlus's continuous, real-time API model; different business model, overlapping customer base
Honeypot.is	Fast, narrow can-it-be-sold honeypot check	Small, specialized	Faster for the single narrow honeypot-check use case; GoPlus offers a much broader product surface
RugDoc	Human-curated pattern warnings, strong on BSC	Small, community-driven	Adds human judgment/notes GoPlus's automated system doesn't provide; narrower chain focus
Scam Sniffer	Anti-phishing, malicious signature/website detection	Small, specialized	Focused specifically on phishing and wallet-signature risk; a narrower slice of what GoPlus's Web3 Security product covers

Blockchain security tooling is a fragmented category with no single dominant winner, and third-party comparisons reviewed for this report consistently describe it as a “use more than one” landscape rather than a winner-take-all market: Token Sniffer wins on brand recognition and its honeypot swap-simulation test, De.Fi wins on governance-permission depth, and GoPlus's own recurring advantage across multiple independent comparisons is breadth of chain coverage — supporting more networks than most narrower competitors. This positions GoPlus less as a single best-in-class point solution and more as the broadest, most widely embedded general-purpose layer, which aligns with its actual go-to-market: infrastructure APIs embedded inside other products (wallets, exchanges) rather than a single destination tool end users visit directly.

CertiK is the most consequential different-category comparison: it is the largest blockchain security auditor by market position, but operates on a fundamentally different model — point-in-time, formal audits rather than GoPlus's continuous, real-time API-based protection. The two are complementary as often as competitive (a project might get a CertiK audit before launch and integrate GoPlus's API for ongoing user protection afterward). GoPlus's most genuinely uncontested position, at least for now, is AI-agent runtime security via AgentGuard — none of the established Web3 security competitors listed above have a comparably developed, named AI-agent protection product as of the data-as-of date, giving GoPlus a real first-mover window in that specific, still-forming category.

10

RECENT NEWS & UPDATES

Date	Event
Q3 2021	GoPlus Security founded / earliest disclosed funding activity begins
Q2 2022	Angel funding round closed (amount undisclosed)
Dec 8, 2022	Private funding round closed with multiple participants (amount undisclosed)
Jun 5, 2024	GoPlus Security raises \$10.00M in a private round led by Binance Labs to build its “permissionless security layer”
2024	Private Round II closes, also led by Binance Labs (amount undisclosed)
Jan 16, 2025	GPS Token Generation Event; token goes live on KuCoin and CoinW with a 10,000 USDT bounty program on CoinW
Feb 2025	GoPlus's SecWareX product reportedly protects over 100,000 users within its first week; services live across 20+ blockchains and 21M+ security data requests cited
Feb 19–24, 2025	Binance HODLer Airdrop qualification window for GPS (based on BNB Simple Earn / On-Chain Yields holdings)
Mar 4, 2025	GPS lists on Binance (11th HODLer Airdrops project); trading opens against USDT, USDC, BNB, FDUSD, and TRY; token jumps as much as 16% on the announcement
Mar 4–5, 2025	A market maker sells 70 million GPS tokens within roughly 24 hours, triggering a sharp price decline
Mar 7, 2025	Binance places GPS on its Monitoring List, citing the token's massive sell-off and unusual market-making activity following the listing
Throughout 2025	GPS registers over \$5B in spot trading volume and \$10B in derivatives volume for the year; Token Security API averages ~717M monthly calls, peaking near 1B in February 2025
2025–2026	GoPlus expands product suite with AgentGuard (AI agent runtime security) and DeepScan (AI-powered token audits), repositioning around securing both Web3 transactions and AI agent actions

The defining event in GPS's short trading history is the March 2025 Binance-listing sequence: a strong initial pop, an immediate large-scale sell-off by a market maker, and a Binance Monitoring List designation within days — a sequence that reflects poorly on early market structure around the token even though it does not implicate GoPlus's underlying security products, which had already been operating independently for several years by that point. This is a meaningfully different risk profile than a product or team failure; it is a market-microstructure and liquidity concern specific to the token's early trading history.

Since that early volatility, the more recent timeline shows a company continuing to execute on its core Web3 security business (sustained high API call volume through 2025) while methodically building out its AI-agent security ambitions (AgentGuard, DeepScan). No further exchange-flagged market manipulation events or security incidents involving GoPlus's own infrastructure were identified in the sources reviewed since the March 2025 Monitoring List episode, which is a reasonably positive sign given how much time has since passed, though investors should note that GPS's Monitoring List status resolution date was not independently confirmed in the sources reviewed for this report.

11

INVESTMENT POTENTIAL & RISKS

▲ BULL CASE

- Rare, independently-verified usage scale for a project this size: ~717M average monthly API calls in 2025 (peak ~1B), with named integrations into MetaMask, Trust Wallet, and Binance — not self-reported claims alone.
- Multi-year (2020–present) operating history that predates the token, giving GPS a rare combination of “new token, established product” rather than the reverse.
- Exceptionally broad, exchange-diverse investor roster (Binance Labs/YZI Labs, OKX Ventures, HTX Ventures, Crypto.com Capital, KuCoin Ventures, HashKey, Fenbushi, Animoca) that directly aligns investor and distribution incentives for a security-infrastructure business.
- Credible first-mover position in AI-agent runtime security (AgentGuard) — a genuinely emerging category with few established, named competitors as of the data-as-of date.
- Long team-vesting structure (6-month cliff, 24-month vesting, 7-year full distribution) is a stronger-than-typical long-term alignment signal if honored as designed.

▼ BEAR CASE

- GPS's early trading history includes a Binance Monitoring List designation within days of listing, following a 70M-token market-maker sell-off — a documented, exchange-flagged market-structure red flag.
- No independently disclosed third-party audit specifically covering the GPS token contract or staking/Security Network consensus mechanism was identified, despite GoPlus's own business being built on auditing others.
- Team transparency is thinner than the investor roster and product track record would suggest — named founders lack easily verifiable, detailed public professional histories across the sources reviewed.
- Highly fragmented, no-single-winner competitive category (Token Sniffer, De.Fi, CertiK, Honeypot.is, RugDoc, Scam Sniffer) means GoPlus must sustain breadth-based differentiation rather than owning a defensible niche outright.
- Meaningful, in places internally contradictory, data variance across sources (rank #169 vs #224 in the same data pull; unusually wide and uniform 24h price moves across exchanges) suggests reporting/liquidity infrastructure is still maturing.
- AgentGuard's first-mover AI-security position is unproven at the usage scale GoPlus's core Web3 products have already achieved; larger, better-resourced security or AI-infrastructure players could enter the same niche.

Risk Factor Detail

Risk	Detailed Explanation
Documented Early Market Manipulation Flag	Binance's own Monitoring List designation, triggered by a 70M-token market-maker sell-off within 48 hours of listing, is a rare case of an exchange itself publicly flagging irregular trading activity around a token covered in this series.
Unaudited Token-Layer Infrastructure	No named third-party audit of the GPS token contract or Security Network consensus/staking logic was found, leaving the token layer itself less independently verified than GoPlus's own detection products.
Team Transparency Gap	Publicly listed founders lack detailed, verifiable professional histories despite the company's multi-year operating track record and strong investor backing, complicating full accountability assessment.

Risk	Detailed Explanation
Category Fragmentation	The security-tooling space has no dominant winner and multiple credible competitors (Token Sniffer, De.Fi, CertiK) each claim specific advantages over GoPlus, meaning sustained execution across many fronts is required rather than defense of one clear moat.
Data Reporting Inconsistency	Rank and price-change figures showed internal contradictions within the same data snapshot, underscoring the need to cross-check any single-source figure before acting on it.
AI-Agent Product Unproven at Scale	AgentGuard's first-mover position in AI-agent security is real but new; it has not yet demonstrated usage comparable to GoPlus's mature Web3 API business, and the category could attract better-resourced entrants.

NBZ RESEARCH VERDICT

GoPlus Security stands out in this research series for a genuinely rare combination: a multi-year operating history predating its token, independently verifiable usage at real scale (hundreds of millions of monthly API calls, named integrations with MetaMask, Trust Wallet, and Binance), and an unusually broad, exchange-aligned investor base. That combination makes GPS worth attention as one of the more evidence-backed infrastructure tokens covered here — this is closer to a working business with a token attached than a token in search of a product. It is not, however, without real scars: the token's early trading history includes a documented, exchange-flagged market-manipulation episode within days of its highest-profile listing, and the absence of any disclosed audit of the token layer itself (as distinct from GoPlus's own auditing products) is a notable, somewhat ironic gap. What would make this materially more bullish: a published, independent audit of the GPS token contract and staking mechanism; more transparent, verifiable founder credentials; and continued, measurable growth in AgentGuard adoption converting GoPlus's AI-agent security first-mover position into the same scale of independently-verified usage its Web3 products already have. The most critical risks are the documented early market-structure red flag, the unaudited token layer, and the crowded, no-clear-winner competitive category GoPlus operates in. Positioning: among the more fundamentals-supported allocations in this series, appropriate for a thesis centered on GoPlus's proven distribution and its early positioning in AI-agent security — sized with the documented early trading irregularity and the token-layer audit gap treated as real, unresolved factors rather than dismissed as one-off noise.

Sources Consulted: Official GoPlus Security whitepaper (whitepaper.gopluslabs.io/goplus-network) and website (gopluslabs.io/en); in-app market data screenshots provided by the user (Aug 2026 snapshot); CoinMarketCap, CoinGecko, BaseScan, and ICO Drops for market and on-chain data; CoinDesk Research for independently-sourced usage and volume statistics; Coinspeaker, BeInCrypto, NFTevening, EconoTimes, MyTokenCap, and CoinGabbar for TGE and Binance-listing timeline coverage; CB Insights for company/team and funding background; Plisio, QuickNode, De.Fi, RektRadar, CryptoLinks, and BlockXS for competitive-landscape context (Token Sniffer, De.Fi, CertiK, Honeypot.is, RugDoc, Scam Sniffer).
