

MEMECORE

\$M · Institutional Research Report

The first Layer-1 blockchain purpose-built for "Meme 2.0" — turning viral culture and on-chain participation into a structured, rewarded economy — evaluated across technology, tokenomics, funding, market performance, ecosystem traction, and forward-looking risk.

TICKER	SECTOR	CHAIN	REPORT DATE
M	Layer-1 / Meme 2.0 Infrastructure	MemeCore (native L1, EVM-compatible)	August 2026

■ SECTION 01

Project Overview

MemeCore (M) is the first Layer-1 blockchain purpose-built for what its team calls "Meme 2.0" — an attempt to move meme coins beyond pure speculation into a structured, participation-driven economy. Rather than hosting memecoins as an afterthought on a general-purpose chain, MemeCore is a standalone EVM-compatible network with its own consensus mechanism, validator set, and purpose-built ecosystem infrastructure for launching and sustaining meme-native tokens.

At the center of the design is Proof of Meme (PoM), a consensus and reward framework that ties network security and token emissions not just to staking, but to on-chain activity, content virality, and community participation. MemeCore's mainnet went live on February 12, 2025, with the \$M token beginning trading on major centralized exchanges on July 3, 2025 — giving the project roughly a year of live-network history by the time of this report.

\$1.11 PRICE (SNAPSHOT)	\$1.49B MARKET CAP	\$11.17B FULLY DILUTED VALUATION	#42 MARKET RANK	-0.23% 24H MOVE (HOTCOIN)
-----------------------------------	------------------------------	--	---------------------------	-------------------------------------

Snapshot

Metric	Value
Token Ticker	M
Category	Layer-1 Blockchain / Meme 2.0 Infrastructure
Circulating Supply	1.33B M
Total Supply	5.40B M
Max Supply	10.00B M
24h Trading Volume	\$6.58M
All-Time High	\$4.835
All-Time Low	\$0.03524
Mainnet Launch	February 12, 2025
Website	memecore.com
Whitepaper / Docs	docs.memecore.com

At a #42 market rank and a market cap approaching \$1.5B, MemeCore is a genuine large/mid-cap asset — materially more established than most projects covered in NBZ Research's typical small-cap pipeline — though its FDV of over \$11B relative to that market cap flags a very large long-term supply overhang worth close attention (see Section 4).

■ SECTION 02

Problem & Solution

The Problem

Traditional meme coins are almost entirely speculation-driven: value is a function of attention and narrative momentum with no structural mechanism connecting price to sustained community contribution. Most meme tokens pump and fade within weeks, benefiting early holders while leaving later participants and genuine community builders with no durable reward for the cultural value they helped create.

The Solution

- **Proof of Meme (PoM)** — a consensus and reward framework that distributes network emissions based on staking plus documented on-chain and cultural contribution, rather than staking alone.
- **Meme Vaults** — automatically generated smart contracts for every new MRC-20 token launched on MemeCore, tracking contribution and distributing rewards transparently on-chain.
- **Meme Reserve mechanism** — 5% of every new MRC-20 token's supply is automatically allocated to a Meme Reserve at creation (1% to M stakers, 4% to meme-token delegators), directly linking new token launches back to network-wide staking rewards.
- **MemeX launchpad** — a social, no-code launchpad (reportedly over 191,000 verified users as of mid-2025) that lets creators mint tokens directly from an uploaded image using bonding-curve pricing.
- **EVM compatibility** — standard Solidity/MetaMask tooling lowers the barrier for developers building meme-native DApps on the chain.

■ SECTION 03

Technology & Architecture

MemeCore runs Proof of Meme (PoM) across a currently small validator set of seven validators, with reward distribution split roughly 75% to M stakers and 24% to meme-token delegators (the remainder supporting protocol operations). Users can delegate memecoins from various supported chains to validators and, in return, earn a dual reward stream of \$M tokens and the underlying MRC-20 meme tokens — a design intended to make staking meme-flavored rather than purely mechanical.

Supporting infrastructure includes an On-Chain Contribution Protocol that scores metrics like content virality and community growth to help direct reward distribution, and a "Proof of Shit" (PoS) bot-filtering verification system that the team reports has reached roughly 82% adoption across the ecosystem. Additional tools include AntsMaker for digital asset creation, a Uniswap-v3-based native DEX for liquidity, and an EcoFund for incubating new meme projects.

Core Components

Component	Function
Proof of Meme (PoM)	Consensus + reward mechanism tying emissions to staking and on-chain cultural contribution
Meme Vaults	Auto-generated smart contracts tracking contribution/rewards for each MRC-20 token
MemeX	No-code social launchpad for creating tokens from an image via bonding curves
On-Chain Contribution Protocol	Scores virality and community growth to guide reward distribution
Proof of Shit (PoS)	Bot-filtering verification layer (~82% ecosystem adoption reported)

The seven-validator set is worth flagging directly: it is small relative to many established Layer-1s, which concentrates network security and censorship-resistance in a limited number of parties during this stage of the chain's decentralization roadmap.

■ SECTION 04

Tokenomics & Allocation

M has a hard-capped max supply of 10,000,000,000 tokens. As of this report's data pull, circulating supply stood at 1.33B M (roughly 13% of max supply) against a total supply already accounted for of 5.40B M (54% of max) — meaning a substantial share of tokens exist on the cap table but remain locked, vesting, or held in reserve rather than freely tradable. The gap between market cap (\$1.49B) and fully diluted valuation (\$11.17B) — roughly 7.5x — is the single most important tokenomics fact for prospective holders to understand.

Allocation Breakdown

Allocation Category	% of Supply
Community	58.00%
Foundation	15.00%
Core Contributors	13.00%
Investors	12.00%
Meme Treasury	2.00%

MemeCore's allocation is unusually community-weighted for a Layer-1 project: 58% of total supply is earmarked for the community, versus a combined 25% for Core Contributors and Investors — a notably lower insider allocation than many comparable infrastructure launches. That said, the enormous gap between circulating supply (13% of max) and total supply already issued (54% of max) means most of that community allocation has not yet reached the open market, and how it is released over time — via PoM staking rewards, ecosystem grants, or other mechanisms — will be the dominant driver of future supply-side pressure. Investors should track official unlock disclosures at docs.memecore.com rather than assuming a fixed linear schedule.

■ SECTION 05

Funding & Investors

In March 2025, the MemeCore Foundation announced a strategic investment round backed by a syndicate of crypto-native venture firms, later expanded with additional participation from DWF Labs, which publicly announced a partnership with MemeCore in September 2025 to support the project as a flagship Meme 2.0 chain — around the same period the M token posted a reported 333% gain.

Investor Tiers

Tier	Notable Backers	Type
Tier 2	DWF Labs	Venture
Tier 3	Waterdrip Capital, IBC Ventures, K300 Ventures	Venture
Tier 4	WAGMI Ventures, CatcherVC, AC Capital, Klein Labs	Venture

DWF Labs' involvement is particularly notable given the firm's dedicated \$20M Meme Fund, launched to back top memecoin projects across chains, and its track record with other high-profile meme assets. As a major market maker as

well as an investor, DWF Labs' participation likely also supports MemeCore's exchange liquidity relationships, though investors should note DWF Labs plays both an investment and market-making role across its portfolio broadly, which is a structural conflict worth understanding generically across any token where it's involved.

■ SECTION 06

Team

MemeCore was founded by Jun (publicly known by a single name/handle), who previously founded 0xLootBox and held leadership roles at Ledger, providing a hardware-wallet and security background ahead of leading a Layer-1 project. He is joined by Cherry Hsu as Chief Business Development Officer, who brings a background in game development and marketing plus a master's degree in computer science from Chang Gung University in Taiwan, and Rudy Rong as Chief Growth Officer.

Name	Role
Jun	Founder & CEO
Cherry Hsu	Chief Business Development Officer (CBDO)
Rudy Rong	Chief Growth Officer (CGO)

The CEO's public presentation uses a single name and a stylized avatar rather than a fully disclosed identity, which several third-party analyses have flagged as a transparency consideration alongside the project's validator-set centralization — worth weighing against the team's demonstrated execution (live mainnet, exchange listings, sustained ecosystem development) over the roughly 18 months since launch.

■ SECTION 07

Market Performance & Liquidity

M's 24-hour trading range at the time of this report spanned \$1.0117 to \$1.161, with the token trading roughly 77% below its all-time high of \$4.835 but dramatically above its all-time low of \$0.03524 — consistent with a token that has completed a full early-stage speculative cycle (rapid post-launch appreciation followed by a substantial, still-ongoing correction) rather than one still finding its initial trading range.

Exchange Liquidity (24h volume by venue)

Exchange	Pair	24h Volume	Price	24h %
Hotcoin	M/USDT	\$3.64M	\$1.11	-0.23%
Bitget	M/USDT	\$516.37K	\$1.11	-0.12%
DigiFinex	M/USDT	\$379.02K	\$1.10	-1.39%
Kraken	M/EUR	\$196.79K	\$1.11	-2.49%
Kraken	M/USD	\$194.14K	\$1.11	-1.92%
Gate	M/USDT	\$136.56K	\$1.12	-0.01%
MEXC	M/USDT	\$113.85K	\$1.11	-0.10%

Exchange	Pair	24h Volume	Price	24h %
BYDFi	M/USDT	\$89.23K	\$1.11	-0.08%
PancakeSwap	M/USDT	\$28.79K	\$1.11	N/A

Hotcoin alone accounts for well over half of visible 24h volume in this snapshot, which is a notable liquidity concentration for a top-50 market-cap asset; more diversified flow across larger venues like Kraken, Bitget, Gate, and MEXC provides some balance, but investors executing larger orders should be mindful of relatively thin depth outside the top one or two exchanges.

■ SECTION 08

Ecosystem & Competitive Landscape

Ecosystem Traction

- MemeX, the flagship no-code launchpad, reported over 191,000 verified users as of July 2025, with bonding-curve token creation directly from an uploaded image.
- Partnerships spanning Four.Meme, Pentagon Games, SQD, and MemeForest add cross-chain reach and gaming-adjacent use cases to the core meme-launch product.
- MemeMax, a Perp DEX built within the MemeCore ecosystem, has run incentive campaigns (including a 'MaxPack Airdrop Campaign') to drive derivatives trading activity on-chain.
- The project marked Korean Blockchain Week (KBW) 2026 with a dedicated side event, signaling active continued community and business-development investment well past initial launch hype.

Competitive Landscape

MemeCore's closest conceptual competitors are other infrastructure plays attempting to formalize the memecoin economy — Solana-based launchpads like pump.fun and pump-adjacent ecosystems, as well as other chain-agnostic meme-focused funds and platforms. MemeCore's differentiation is architectural: rather than being a launchpad sitting on top of an existing general-purpose chain, it is a standalone Layer-1 with its own consensus tuned specifically for meme-economy incentives. That structural bet raises the ceiling (owning the full stack, capturing more value) but also raises execution risk relative to simpler launchpad models, since MemeCore must compete on both base-layer technical merits and meme-culture virality simultaneously.

■ SECTION 09

Roadmap & Outlook

With mainnet live since February 2025 and roughly eighteen months of operating history by the time of this report, MemeCore's near-term priorities center on validator-set decentralization, continued ecosystem tooling (MemeX, AntsMaker, MemeMax), and managing the large gap between circulating and total supply as more tokens become liquid over time.

- Watch for validator-set expansion beyond the current seven validators, which would meaningfully improve the network's decentralization profile.
- Watch for the pace of supply unlocks from the 54% of total supply already issued but not yet circulating — the single largest medium-term price risk for existing holders.
- Watch for MemeX and MemeMax usage metrics (active creators, launched tokens, DEX/Perp volume) as the clearest read on whether ecosystem activity is growing or plateauing post-hype.

■ SECTION 10

Bullish Case, Bearish Case & Risk Factors

▲ BULLISH CASE	▼ BEARISH CASE
+ Genuine top-50 market cap asset (#42 rank, ~\$1.49B market cap) with roughly 18 months of live mainnet history — far more established than most newly launched competitors. + Unusually community-weighted tokenomics (58% of supply earmarked for community) relative to many Layer-1 launches, with a comparatively modest 25% combined Core Contributor + Investor allocation. + Differentiated full-stack architecture (own consensus, own validator set) rather than a launchpad layered on an existing chain, positioning it to capture more value if the Meme 2.0 thesis plays out. + Active, credible investor and market-maker backing including DWF Labs, alongside a broad set of specialized venture funds. + Demonstrated ecosystem breadth — MemeX (191K+ users), MemeMax Perp DEX, AntsMaker, and an EcoFund — well beyond a single-product launch.	– Very large FDV-to-market-cap gap (~7.5x) reflects a substantial future supply overhang as more of the 10B max supply becomes circulating. – Token trades roughly 77% below its all-time high, reflecting a completed speculative boom-bust cycle typical of meme-adjacent assets. – Small seven-validator set concentrates network security and censorship-resistance in a limited number of parties. – Founder and CEO ("Jun") uses a single name and stylized avatar rather than complete public disclosure, a moderate transparency limitation for a top-50 asset. – Category risk: meme-economy infrastructure plays depend on sustained cultural relevance and viral participation, which is inherently harder to forecast than utility-driven demand.

Key Risk Factors

Risk Factor	Severity	Description
Supply Overhang	High	Only ~13% of 10B max supply is circulating versus 54% already issued; FDV is ~7.5x current market cap.
Validator Centralization	Medium	Network currently secured by only seven validators, concentrating trust and censorship-resistance.
Post-ATH Drawdown	Medium	Token trades ~77% below its all-time high, reflecting a completed speculative cycle.
Team Transparency	Low	Founder/CEO uses a single name and stylized avatar rather than full public disclosure.
Liquidity Concentration	Medium	A single exchange (Hotcoin) currently represents the clear majority of visible 24h volume.
Narrative Dependency	Medium	Long-term value depends on sustained meme-culture relevance and viral participation, which is inherently unpredictable.
Macro / Crypto Beta	Medium	As a top-50 but still mid-cap altcoin, M remains correlated with broader crypto market cycles.

■ SECTION 11

Investment Potential and Risks

MemeCore stands out from most projects in this coverage series simply by virtue of scale and maturity: a top-50 market cap, roughly eighteen months of live mainnet operation, credible venture and market-maker backing, and a genuinely differentiated architectural bet on owning the full meme-economy stack rather than sitting atop someone else's chain. Its community-weighted tokenomics (58% of supply) are also a structural positive relative to many insider-heavy Layer-1 launches.

Against that, the nearly 7.5x gap between market cap and fully diluted valuation is a serious consideration: the large majority of MemeCore's total supply has not yet reached circulation, and how that unlocks over coming years will be the dominant factor in long-term price performance regardless of ecosystem execution. The token's ~77% drawdown from all-time highs also reflects the boom-bust pattern common to meme-adjacent assets, and the small seven-validator set and partially undisclosed leadership are real, if moderate, structural considerations for a top-50 asset.

NBZ RESEARCH VERDICT

Rating: ESTABLISHED / MODERATE-TO-HIGH RISK — Monitor Supply Unlocks

MemeCore is a genuinely differentiated, well-capitalized attempt to formalize the memecoin economy at the base-layer rather than the application layer, with meaningful live-network history and community-favorable tokenomics working in its favor. The scale of its supply overhang, however, means long-term holders are making a bet on sustained ecosystem growth outpacing several years of ongoing token unlocks — a materially different risk profile than the token's current market cap alone suggests. NBZ Research views MemeCore as a more established, moderate-risk entry relative to typical early-stage coverage in this series, best suited to investors comfortable underwriting both continued meme-culture relevance and a multi-year supply unlock horizon, rather than a short-term speculative trade.
